"4.6.1.5.1 Sampling plan. A sample of n_s batteries shall be selected at random from production for each shipment lot in amounts determined from the following formula, and rounded off in case of fractions to an adjacent integer (up or down for each shipment lot), so that exactly n batteries have been assigned to both T and D capacity tests when the sample for the final shipment of the contract lot has been drawn.

$$n_s = a + (N_s/N) \times 2n$$

Where:

a= 10 batteries for ILR capacity testing
n_s= total number of sample batteries to be taken from each shipment lot.
N_s= number of batteries in the shipment lot.
N= number of batteries in the contract lot (see Table VII).
n= number of batteries to be taken from the contract lot for each of two capacity tests, T and D, in accordance with Table VII (total number of T and D samples selected is 2n)."

Add the following new paragraph:

"4.6.1.5.1.1 Allocation of sample batteries for Group D inspection. The number of batteries, n_s, selected from a shipment lot, shall be assigned at random at the Government test facility, so that 10 batteries shall be submitted for the ILR capacity test and the remainder (n_s-10) split approximately in half for the T and D tests. Such assignment shall result in the allocation of exactly n batteries to both T and D capacity tests after the final shipment on the contract lot is made. If necessary, the sample size n_s taken from the last shipment lot of the contract lot shall be adjusted so that this result is achieved."
