DATA ITEM DESCRIPTION
Title: POWER SOURCE QUALITY ANALYSIS REPORT

Number: DI-SESS-82286
AMSC Number: N10070
DTIC Applicable: N/A
Preparing Activity: AS
Applicable Forms: N/A

Approval Date: 20190815
Limitation: None
GIDEP Applicable: No
Project Number: SESS-2019-036

Use/Relationship: The Power Source Quality Analysis Report documents the predicted power quality of an electrical power system as compared to the standard power characteristics defined by MIL-STD-704. The data will be used to verify the interoperability of electrical power sources and utilization equipment

This Data Item Description (DID) contains the format, content and intended use information for the Power Source Quality Analysis Report resulting from work tasking described by the contract statement of work.

Requirements:

1. Reference Documents. The applicable issue of the documents cited herein, including their approval dates of any applicable amendments, notices, and revisions shall be as specified in the solicitation or contract.

(Copies of the Department of Defense Interface Standard, MIL-STD-704, Aircraft Electric Power Characteristics are available online at (https://quicksearch.dla.mil/)

2. Format. The contractor's format is acceptable.

3. Content. The report shall include the following information:

3.1 A description of the model.

3.2 A description of the methods used to generate the model

3.3 A justification of the validity of the selected modeling approach

3.4 The results of modeling the electrical power system, including:

3.4.1 Power quality of each electrical power source within the system performance during all operating conditions, including source failures

Source: https://assist.dla.mil -- Downloaded: 2026-10-26T11:01Z
Check the source to verify that this is the current version before use.

3.4.2 A comparison of the power quality results to the power quality limits in MIL-STD-704

3.4.3 The ability of system utilization equipment to operate when provided with nominal, abnormal, and emergency power from each power source within the system.

3.4.4 The limits of the ability of system utilization equipment to handle transient conditions outside of MIL-STD-704

3.4.5 Performance of the power regulation equipment when connected to the utilization equipment, including:

3.4.5.1 Regions of stable operation

3.4.5.2 Amount of positive control margin

3.4.6 The control logic and states of the electric power system including operation during normal, abnormal, and source failure conditions

End of DI-SESS-82286
