MILITARY STANDARD

PROCUREMENT DATA PACKAGES

1. SCOPE

1.1 Purpose. This standard sets forth requirements for identification, selection, and preparation of procurement data packages to be purchased by the Government pursuant to designated procurement methods which will permit the maximum degree of competition.

1.2 Application. This standard applies to design activities/manufacturers for development of procurement data packages suitable for the Government to procure selected hardware items designated for procurement.

1.3 Use. This standard identifies the contents of procurement data packages. Procurement data packages are for use in procurement actions and shall not contain data that cannot be used for this purpose.

2. REFERENCED DOCUMENTS

2.1 The following documents, of the issue in effect on the date of invitation for bids, requests for proposal, or quotation, form a part of this standard to the extent specified herein:

SPECIFICATIONS

DD Form 1418-1	Procurement Data Identification Checklist
DD Form 1423	Contract Data Requirements List

(Copies of specifications, standards, drawings, and publications required by suppliers in connection with specific procurement functions should be obtained from the procuring activity or as directed by the contracting officer.)

3. DEFINITIONS

3.1 Hardware item. A hardware item is a configuration item as defined in MIL-STD-480 and includes any item, component, equipment, and parts thereof separately procured. It may be: (a) part of a larger system (e.g. missile guidance system), (b) a part used in any Government equipment (e.g. resistor, fuel pump, capacitor), or (c) a support item (e.g. ground, power supply, fuel truck, handtools) etc. (Source: MIL-STD-480.)

3.2 Procurement data package. Procurement data package is a generic term applicable to types of technical data when used for procurement purposes. It is a composite of specifications, plans, drawings, standards, and such other data as may be necessary to describe existing materiel so they may be procured by the method contemplated. (Source: MIL-STD-789.)

3.3 Specification. A specification is a document used in procurement which clearly and accurately describes the essential and technical requirements for items, materials, or services, including procedures by which it can be determined that the requirements have been met. Specifications for items and materials may also contain preservation, packaging, packing, and marking requirements.

Source: https://assist.dla.mil -- Downloaded: 2026-10-23T23:05Z
Check the source to verify that this is the current version before use.

3.4 Engineering data and associated lists. Engineering data and associated lists are parts lists, assembly and subassembly drawings, installation drawings, detail (parts) drawings, drawings for special relationships (e.g. matched parts, altered, and selected items), tube bend data, schematic wiring diagrams, and specifications and standards on drawing format used to define a hardware item in terms of materials, physical configuration, and, if applicable, performance.

3.5 Purchasing data. Purchasing data are documents which contain information described in ASPR 1-1206 or MIL-STD-100 required to purchase an item. Included are specification control drawings, source control drawings, envelope drawings, detail drawings, standards, federal item identification guides, and any other document providing information which identifies and provides for acquisition of supplier-type products needed to fabricate or assemble or both into an item represented by a procurement data package (e.g. fuel pumps, switches, wheels, cables, capacitors, bulk materials).

3.6 Manufacturing data. Manufacturing data is information essential to manufacturing, and includes the required performance of special/peculiar/unique manufacturing operations. It may include techniques, procedures, and processes that describe how a part, parts, or an entire assembly is manufactured (e.g. drawings, specifications, special data).

3.7 Verification data. Verification data is information used to check or test items to assure their proper performance and configuration as specified (e.g. specifications, standards, test equipment and facility identifications, test procedures, quality assurance provisions).

3.8 Shipping and storage data. Shipping and storage data are documents that describe how an item shall be packaged, transported, marked, stored, and handled.

3.9 Procurement data package activity. A procurement data package activity is any activity (contractor/subcontractor/vendor) that identifies, selects, and prepares a procurement data package.

3.10 Functional data. Functional data are documents within a procurement data package that perform a specific function. Purchasing data is an example of functional data which may be included in a procurement data package. Also refer to the categories in MIL-D-1000 as examples.

3.11 Special procurement data. Special procurement data are documents prepared for a procurement data package that have no other known functional use, except for the procurement of the item.

Source: https://assist.dla.mil -- Downloaded: 2026-10-23T23:05Z
Check the source to verify that this is the current version before use.

4. DETAIL REQUIREMENTS

4.1 Preparation of procurement data packages

4.1.1 Procurement data packages shall be developed by any design/manufacturing activity having the knowledge/information to develop the required package, except that, when a procurement data package(s) has been ordered for competitive acquisition of an identical item, the designer/manufacturer of that item(s) shall develop the package. Procurement data packages shall be developed for end items of hardware and their spare parts as specifically identified and negotiated.

4.1.2 Procurement data packages shall be developed by identifying/selecting/preparing required data, after a hardware item and its method of procurement (MIL-STD-789) have been identified by the procuring activity. The procurement data package developed shall be sufficiently complete so that the hardware item can be procured by the method of procurement identified. Packages shall be complete within themselves to produce the required item without recourse to additional design data.

4.1.2.1 The procuring activity shall be advised when, in the opinion of the contractor/procurement data package activity, an adequate package (including the right to use by other sources) cannot be developed/furnished to support an identified method of procurement or in the opinion of the contractor, the procurement method assigned could result in an adverse position for subsequent system support. Details concerning the discrepancy(ies) shall be provided with a recommended solution. The procuring activity will determine in coordination with the contractor and Government office responsible for resolving the identified discrepancy(ies), an appropriate resolution. Contract requirements will be negotiated with the contractor, when applicable, upon receipt of such resolution. (Adequacy shall not be dependent upon current data, see 6.1.)

4.1.2.2 Procurement data packages, based on the method of procurement determined for an item, and data which are or can be made available for a procurement, are identified/selected/prepared for:

a. Competitive (open competition) acquisition of identical items.

b. Competitive (open competition) acquisition of interchangeable items.

c. Competitive (negotiated) acquisition of items from selected qualified sources.

d. Noncompetitive (sole or directed source) acquisition of items.

NOTE: Refer to MIL-STD-789 for detail regarding contractor-recommended codes and procurement method codes.

Source: https://assist.dla.mil -- Downloaded: 2026-10-23T23:05Z
Check the source to verify that this is the current version before use.

4.2 Procurement data packages. The various kinds of data/information and levels of detail (purchasing, manufacturing, verification, etc, information) that could be within a procurement data package, depending upon an item and its method of procurement are herein identified. The top document of each procurement data package shall be the basic document under which all documents for the package are identified/assembled. All data identified for procurement data packages shall be conventional-type data (reference 4.6) unless contract provisions provide for special-type data. There are four recognized types of procurement data packages as follows:

4.2.1 Competitive acquisition of identical items. A procurement data package for competitive acquisition of identical items is normally referred to as a design disclosure package. The package shall contain as a minimum, the necessary design, engineering, manufacturing, and quality support information to enable the competitive procurement, without additional design effort or recourse to the original activity, of an item that duplicates the physical and performance characteristics of the original design. It also includes process information when such is essential to accomplish manufacture by other than the original source. (See MIL-STD-280 for definition of an identical item.)

4.2.2 Competitive acquisition of interchangeable items. A procurement data package for competitive acquisition of interchangeable items is normally referred to as a form, fit, and function package. The package shall contain as a minimum, sufficient description to enable the procurement of the same item from the original manufacturer, or the competitive procurement of a functionally and physically interchangeable item from other sources. (See MIL-STD-721 for definition of an interchangeable item.)

4.2.3 Competitive acquisition of items from selected sources. A procurement data package for competitive acquisition of items from selected sources is normally referred to as a form, fit, and function package. This package differs from the form, fit, and function package specified in 4.2.2 in that it depicts an existing item available on an unrestricted basis as an off-the-shelf item or an item which, while not commercially available, is procurable on order from a specialized segment of Industry. The suggested sources are normally identified in, or as a part of, this package. (See MIL-STD-100, specification control drawing requirements.)

4.2.4 Noncompetitive (sole or directed source)acquisition. A procurement data package for noncompetitive (sole or directed source) acquisition may be identified and acquired as one of the following:

a. A design disclosure package to define a specific hardware configuration for procurement from the original source.

Source: https://assist.dla.mil -- Downloaded: 2026-10-23T23:05Z
Check the source to verify that this is the current version before use.

b. A data list identifying the applicable documents (noting their revision) of a design disclosure package which represents a hardware configuration for procurement from the original source.

c. A package/document that depicts an existing item which exclusively provides the performance, installation, and interchangeability characteristics required for one or more critical applications (see MIL-STD-100, Source Control drawing requirement.)

4.3 Identical items

4.3.1 Top document. The top document of a procurement data package for an identical item shall be traceable to and identified with the configuration identification documentation under which the item was designed, developed, produced, and accepted. Thus:

a. The top document shall be a detail performance specification developed under MIL-STD-490 or a military specification. If neither of the above procedures was used, an equivalent performance document shall be the top document.

b. Specifications shall be top documents for configuration items at all levels of item complexity.

c. Specifications or drawings, as applicable, shall be top documents for items used in the assembly of configuration items. A specification shall be the top document wherever feasible. A detail drawing shall be the top document for piece parts.

4.3.2 Detail of data. This package shall include necessary design disclosure information selected from requirements set forth in 4.6. Form, fit, and function data may be the only necessary data for commercial parts (see 4.4.2).

4.4 Interchangeable items

4.4.1 Top document. The top document of a procurement data package for an interchangeable item is determined based on the item and its method of procurement. Thus:

a. A performance or function specification can be used as the top and only document.

b. In cases where military or contractor prepared performance or function specifications do not apply, a specification or source control drawing may be the top (or only) document.

Source: https://assist.dla.mil -- Downloaded: 2026-10-23T23:05Z
Check the source to verify that this is the current version before use.

4.4.2 Detail of data. This package shall include necessary form, fit, and function type information selected from requirements as set forth in 4.6. Design disclosure information may be included, when appropriate. When contract requirements so state, or when the performance and reliability requirements of an end item require detail control, then detail standards for the item/part requiring control shall be specified in the top document to assure interchangeability of the internal part(s).

4.4.2.1 Purchasing data (see 3.5) for an item may constitute the procurement data package for that item when it is suitable for procurement of the item in accordance with its established method of procurement (e.g. specification control drawing for a subcontractor/vendor item).

4.5 Noncompetitive (sole or directed source) procurement data packages. Procurement data packages shall be identified/selected/prepared in sufficient detail to define the configuration of the item at the time of contracting and to establish its baseline for subsequent changes during production under the follow-on contract. The package, subject to contract requirements negotiated, may consist of only a list of applicable documents, identifying their appropriate revision status.

4.6 Procurement data selections (see 4.1.2.1). The procurement data package activity shall select from the following data/information, the total information necessary to accomplish the assigned method of procurement for each hardware item identified. Data developed/acquired under the contract to which this requirement pertains, and other required contractor, subcontractor/vendor, Government, industry association, et cetera, data, regardless of development/preparation origin shall be included. Potential needs are herein expressed in terms of performance data, purchasing data, manufacturing data, et cetera. This does not require different functional data packages to be prepared. If, for example, the manufacturing information, test information, purchasing information, et cetera, needed are included in a single document, that document shall be identified for the package as opposed to extracting the information and presenting it in multiple documents. Documents such as technical orders, catalogs, pamphlets, recordings, manuscripts, and technical reports shall not be referenced or contained on the procurement data package list unless that document is related to only that item and the information therein contains specific requirements needed in the procurement data package.

4.6.1 Specification. A specification shall be prepared or selected, when appropriate, to describe the functional and performance requirements of the item.

Source: https://assist.dla.mil -- Downloaded: 2026-10-23T23:05Z
Check the source to verify that this is the current version before use.

4.6.2 Engineering drawings and associated lists. Engineering drawings and associated lists shall be prepared or selected as necessary to support functional needs (e.g. applicable categories of intended use as defined in MIL-D-1000.) Drawings suitable for procurement of identical items shall be prepared for:

a. Complete end items

b. All subassemblies

c. All components, except components of subassemblies covered by authorized specification-control and source-control drawings.

d. All parts, except for nonrepairable subassemblies or components.

4.6.3 Purchasing data. Purchasing data shall be prepared or selected as necessary to identify hardware items and materials to be acquired for manufacture and/or assemblage into the item, and to acquire such items and materials from suppliers.

a. A procurement data package shall not include supplier's (subcontractor/vendor) engineering drawings for commercial items adequately identified on data furnished.

b. Supplier items, which for any reason must be controlled, shall be supported by appropriate specification or source control drawings.

c. Information shall be included, as applicable, for required qualification or reliability testing of hardware acquired from suppliers, except for those items used unmodified, that are identified on a Government Qualified Products List (QPL).

d. A list shall be prepared to identify items which require acquisition from selected sources (e.g. QPL items, specification/source control items, and items requiring parts control) and the purchasing data for the controlled items.

4.6.4 Manufacturing data. Manufacturing data necessary to delineate special/peculiar/unique information essential for another source to manufacture, shall be included in a procurement data package. As a minimum, sufficient identification shall be provided to make second-source manufacturers aware of a need (what is required) for such special/peculiar/unique manufacturing/assembly so they can develop their own (how-to-do) information to manufacture/assemble. A block diagram summarizing the sequence of fabrication/assembly shall be included when critical and essential to obtain the required

Source: https://assist.dla.mil -- Downloaded: 2026-10-23T23:05Z
Check the source to verify that this is the current version before use.

performance level. A list for required special/peculiar tooling and facilities necessary for manufacture of the item shall be prepared, in accordance with figure 1. The tool/facility item identification number shall be, or shall include, the item's top drawing number; and the title listed shall agree with the top drawing title. The identification/title of each item requiring special tooling/facilities shall be listed in alphabetical order. The procedure/ requirement number and title shall be shown opposite the items they concern.

4.6.5 Verification data. Verification data (requirements and procedures) shall be included as necessary for checking or testing the item to assure its proper performance as intended and specified. Procedural data included in a package shall be limited to special test equipment, precision measuring equipment, and related facilities requirements procedures. Included are specifications, data for special testing/measuring equipment, and procedures for gaining results from their use, their operating and maintenance instructions, or any other data of a special/peculiar nature significant for validation including quality assurance provisions.

a. When the complexity of the test program requires the publication of separate documents for items or subassembly specifications and test procedures, both documents shall be furnished under the requirements of this standard.

b. Maintenance, calibration, or operating instructions necessary for special or precision inspection or test equipment designed to inspect or test items or subassemblies, shall be furnished.

c. Procedures developed in conjunction with special test/measuring equipment, together with any operating instructions, shall be included as necessary. They shall be sufficiently complete to enable a competent inspection/test facility to operate, maintain, and calibrate necessary special test/measuring equipment required for verification, test, and quality assurance.

d. This standard is not applicable to the procurement of general quality control procedures required by MIL-I-45208, MIL-Q-9858, or MIL-C-45662. However, peculiar inspection procedures required to assure the quality or reliability of specific components, items, or assemblies are required.

e. Quality assurance data developed around normal internal skills and procedures to meet quality assurance requirements of the contract shall not be included (e.g. MIL-Q-9858).

f. A list shall be prepared to identify all special test equipment, measuring equipment, and test facilities necessary to support the verification data submitted with the procurement data package in accordance with figure 2. The item identification numbers shall be/or include the item's top drawing number, and the title listed shall agree with the top drawing title. The identification/title of each item requiring special test/measuring equipment and/or facility shall be listed in alphabetical order. The test specification, procedures, etc, number and title shall be listed opposite the item(s) they concern.

4.6.6 Shipping and storage data. Shipping and storage data shall not be identified for inclusion on the procurement data package list, or delivery as a result of this standard. (Such data are developed, submitted, and approved in accordance with applicable data item(s) stipulated on the DD Form 1423 of the contract.) This does not waive a requirement to prepare section 5 of item specifications on Preparation for Delivery, and it does not preclude the ordering of a procurement data package for a package or container.

4.7 Procurement data package lists

4.7.1 Each procurement data package shall have a data list identified to the hardware item the package represents. The list shall identify each document and revision/date thereof needed to include contractor, subcontractor/vendor data, military specifications/standards, industry association specifications/ standards, etc. The list shall be prepared on the format illustrated by figure 3. Instructions for completing the format are provided as appendix A to this standard. When authorized by the contract:

a. DD Form 1418-1 may be used to identify procurement data packages for spare parts.

b. Lists may be prepared by the application of Automatic Data Processing System (ADPS) techniques. Lists shall utilize either 8-1/2 x 11 or 11 x 17 inch size formats. Lists prepared by ADPS techniques shall follow preparation requirements as provided herein. Preprinted formats need not be utilized if normal marking operations can duplicate format headings. Size of ADPS listings shall be commensurate with machine capability and normal size marginally punched continuous blank paper stock.

4.7.2 In addition to special lists identified herein as specific requirements, other associated lists as mutually agreed may result during review of the data package content, and shall also form a part of the package (lists for engineering, purchasing, manufacturing, etc).

4.8 Revisions to and maintaining a procurement data package. Procurement data packages shall be maintained current with revised data, new data, and new lists as a result of design changes. (Reference: MIL-STD-480 and MIL-STD-481 as contractually applies). NOTE: MIL-STD-480 superseded ANA Bulletin 445, however, ANA Bulletin 445 should be referenced if a contract requirement. Procurement data packages may also be revised/changed as a result of the method of procurement for the item changing.

4.8.1 Procurement data packages received by a contractor which were not developed under provisions of this standard, and do not include such information as purchasing, manufacturing, and verification data, shall be upgraded to incorporate such information in accordance with this standard, and a complete new procurement data list prepared when specifically required by the contract.

4.8.2 When a method of procurement for an item is changed, the contractor shall develop a new procurement data package for the item which will support the items latest method of procurement.

4.8.3 When new data are required as a result of design changes, the design activity adding the data shall include its name and code identification on the new data and provide a revised procurement data list for the package. The same shall apply when existing data within a package requires revision, and new data are prepared; except that new data shall also include a note to the effect: This (document type) (replaces, supplements, etc) (document, number, page number, and revision letter) and the (replaced documents manufacturer's code identification number). (For example, this drawing replaces drawing 1234 revision C MFGR's code 00000.) Any other associated lists affected shall also be updated in the same manner.

4.8.4 When existing data are changed, the design activity making such change shall not in any way, obliterate, or interfere with the identification of the previous design activity. (Code identification number, etc.)

4.9 Preparation of data for procurement data packages. The preparation of all data furnished/identified for a procurement data package shall be as contractually set forth on the DD Form 1423 for the type and kind of data included. When preparation requirements for the type and kind of document needed are not set forth on the DD Form 1423, preparation shall be accomplished in accordance with the practices used by the procurement data package activity preparing the package. When a specification is prepared for a procurement data package and the contract does not set forth preparation requirements for the type to be prepared, MIL-STD-490 shall apply for preparation. When drawings are prepared for a procurement data package and the contract does not set forth preparation requirements, the requirements of MIL-D-1000, form 1 shall apply.

Source: https://assist.dla.mil -- Downloaded: 2026-10-23T23:05Z
Check the source to verify that this is the current version before use.

5. QUALITY ASSURANCE PROVISIONS

5.1 Quality assurance provisions included in data preparation documents for data included in a procurement data package shall apply, as well as the quality assurance specifications applicable to the contract.

5.2 The responsible Government activity may periodically review data during its preparation to assure proper understanding/compliance with preparation requirements. Reviews may be accomplished during preliminary/critical design reviews, configuration audits, at the time of provisioning, procurement method code verification, and/or other appropriate events as contractually identified. The reviews will cover as a minimum, but need not be limited to:

a. Evaluation of criteria used in preparing/selecting the contents of the procurement data package.

b. Format, technical adequacy, and completeness of document contents for contract compliance.

c. Completeness and adequacy of the procurement data package contents to requirements of this standard.

d. Evaluation of drafting practices to contract requirements.

6. DELIVERY

6.1 Engineering orders (EOs), or equivalent change forms, shall be included in a procurement data package (except for final orders) when a delivery is called for and incorporation of changes into the data would unduly delay the required delivery. The EOs shall be provided as interim information pending revision of required affected documents. Upon incorporation of the revised information, data shall be delivered as contractually negotiated.

6.2 When a procurement data package is ordered, the data to be delivered shall be as set forth in the contract/DD Form 1423 at the time of order. Data needed and available through normal supply channels of/for the Government shall not be furnished as part of the package. (For example, military specifications and standards, drawings and lists previously furnished the procuring activity, Industry association standards, etc).

6.3 Special provisions may be set forth in the contract for any particular/peculiar contract situation regarding acceptance, recall of services, correction of errors, omissions, etc.

7. REPRODUCTIONS

7.1 The procurement data package lists and the documents furnished for the procurement data package under the data item description which references this standard shall be furnished as specified on the DD Form 1423. Those documents, which must be used in a stable base material form for manufacture, shall be furnished on a stable base material.

7.2 Requirements for preparation of reproductions shall be as set forth in the contract.

APPENDIX A

INSTRUCTIONS FOR COMPLETION OF PROCUREMENT DATA PACKAGE LISTS

10 SCOPE

10.1 This appendix covers the instructions for completing the procurement data package list format as shown on figure 3 of this standard.

20 REFERENCED DOCUMENT

20.1 The following document, of the issue in effect on the date this standard is invoked, forms a part of the standard to the extent specified in this appendix:

CATALOGING HANDBOOK

H 4-1 Federal Supply Code for Manufacturers (United States and Canada) - Name to Code

(Application for copies should be addressed to the Superintendent of Documents, Government Printing Office, Washington DC 20402.)

30 FORMAT INSTRUCTIONS

30.1 The following instructions shall be adhered to in completing the numbered blocks shown on figure 3 of this standard:

Block 1 - Type of procurement data package. Enter the method of procurement the procurement data package was developed to support (e.g. acquisition of identical item, acquisition of interchangeable item, noncompetitive acquisition of item).

Block 1A - Procurement method code. Enter the contractor recommended procurement method code. (MIL-STD-789, CRC 6, 7, or 8).

Block 2 - Contract number. Enter the Government contract number under which the procurement data package was determined. (See block 5 instruction.)

Block 3 - Code identification. Enter the Handbook H 4-1 manufacturer's code of the procurement data package activity that developed the package. (See block 5 instruction.)

Block 4 - List number. The procurement data list number shall be the same number as that of the top document of the procurement data package, preceded by PDL.

Check the source to verify that this is the current version before use.

Block 5 - Revision. When a list is initially prepared, enter a dash (-) and the release date on each sheet of the list. Each time a sheet of the list is revised, enter the appropriate revision letter (A, B, C, etc) and the revision date on the revised sheet and the first sheet. When a list is revised by a design activity other than whose code appears in block 3, the activity revising the list will enter its code in block 3 and its contract number in block 2 of the first sheet and each sheet it revised/added.

Block 6 - Item identification. Identify as complete as practical in the space provided, the name of the item the procurement data package represents. (Where available/obtainable include part/model number, AERNO number, federal stock number.)

Block 6A - Procuring activity. Enter the procuring activity that requires the procurement data package (e.g. OCAMA, ESD, DLSC) for procurement use.

Block 7 - Responsible activity. Enter the Government office having engineering responsibility for the item shown in block 6 (e.g. HQMC, MCSA, AFSC, NAVELEX) and the symbol would be the symbol of the office responsible for approving engineering changes for the item (e.g. CSY-3, 840).

Block 8 - Sheet number. Enter the sheet number and number of sheets using a consecutive numbering system. When, during revision the sheet total changes, sheet numbers of the original list may change. Sheets renumbered only do not constitute a sheet revision requiring compliance with block 5 instructions.

Block 9 - Code identification number. Enter the Handbook H 4-1 code identification number for the design activity of each document entered in block 10.

Block 10 - Document number. Enter the assigned number of each document required in the procurement data package. The top document for the package shall be listed first, followed by drawings, lists (parts, data, special), specifications, standards, publications, and other documents. List each group in alphanumerical sequence. When a data list is entered which identifies documents required for a procurement data package, a copy of the data list shall be attached to the procurement data package list, and documents listed thereon need not be separately listed.

Block 11 - Sheet number. Enter the sheet number for documents that are listed multiple times on the list (e.g. drawing having two or more sheets). Documents such as a specification listed once on the list do not have sheet entries.

Block 12 - Revision letter. Enter the latest revision letter or issue symbol of the document listed in block 10.

Check the source to verify that this is the current version before use.

Block 13 - Item specifications. Enter an (X) in this column for the specification that represents the end item and each one that represents a component thereof.

Block 14 - Company documents. Enter an (X) in this column for each contractor/subcontractor/vendor document.

Block 15 - Industry association documents. Enter an (X) in this column for each industry association document.

Block 16 - Military document. Enter an (X) in this column for each military document.

Block 17 - Document nomenclature. Enter the assigned noun or noun phrase (document's nomenclature) for each document entered in block 10.

Block 18 - Distribution. Enter the Government office to which the document entered in block 10 was furnished. There will be no entry for military or industry association documents. Entries for this column may be by code with the code(s) identified in block 17 on the last page of the procurement data list.

Block 19 - Design activity. Enter the design activities office/department that determined/was responsible for determining the procurement data package content, the person responsible (supervisor project officer), and his signature.

Block 20 - Responsible Government activity. Enter the Government office having engineering responsibility for the item the procurement data package was prepared for. The responsible Government activity block need not be completed for a list covering a replenishment spare part, unless such is contractually requested for certain parts.
