MIL-S-8834F
8 June 1977
SUPERSEDING
MIL-S-8834E
24 July 1973

MILITARY SPECIFICATION

SWITCHES, TOGGLE, POSITIVE BREAK, GENERAL SPECIFICATION FOR

This specification is approved for use by all Departments and Agencies of the Department of Defense.

1. SCOPE

1.1 This specification covers the military service requirements for snap-action, nonteasable, positive-break and make, one-hole mounting toggle switches. These switches are intended for use in alternating current (ac) and direct current (dc) applications for dry circuit, low level, and power switching. The sealing characteristics covered by this specification include toggle sealed devices and environmentally sealed devices (see 6.1).

2. APPLICABLE DOCUMENTS

2.1 Issues of documents. The following documents, of the issue in effect on date of invitation for bids or request for proposal, form a part of this specification to the extent specified herein.

SPECIFICATIONS

FEDERAL

FF-W-100	- Washer, Lock (Tooth).
QQ-B-626	- Brass, Leaded and Non-Leaded, Rod, Shapes, Forgings, and Flat Products with Finished Edges (Bar and Strip).
QQ-B-750	- Bronze, Phosphor, Bar, Plate, Rod, Sheet, Strip, Flat Wire, and Structural and Special Shaped Sections.
QQ-N-290	- Nickel Plating (Electrodeposited).
QQ-P-416	- Plating, Cadmium (Electrodeposited).
QQ-S-698	- Steel, Sheet and Strip, Low-Carbon
ZZ-R-765	- Rubber, Silicone.

MILITARY

MIL-F-15160	- Fuses, Instrument, Power and Telephone, General Specification for
MIL-M-14	- Molding Plastics and Molded Plastic Parts, Thermosetting.
MIL-P-997	- Plastic Material, Laminated, Thermosetting, Electrical Insulation Sheets, Glass Cloth, Silicone Resin.
MIL-W-5086	- Wire, Electric. Hookup and Interconnecting Polyvinyl Chloride-Insulation Nylon Jacket, Tin-Coated Copper Conductor, 600 volt, 105°C
MIL-C-5809	- Circuit Breakers, Trip-Free, Aircraft, General Specification for
MIL-T-7928	- Terminals, Lug and Splices, Crimp Style, Copper
MIL-E-9500	- Ethylene, Glycol, Technical

Beneficial comments (recommendations, additions, deletions) and any pertinent data which may be of use in improving this document should be addressed to Aeronautical Systems Division, ASD-ENESS, Wright Patterson AFB, OH 45433 by using the self-addressed Standardization Document Improvement Proposal (DD Form 1426) appearing at the end of this document or by letter.

MIL-P-15037 - Plastic Sheet, Laminated, Thermosetting, Glass-Cloth, Melamine-resin.
MIL-P-18177 - Plastic Sheet, Laminated, Thermosetting, Glass Fiber Base, Epoxy-Resin.
MIL-S-28786 - Switches, Preparation for Delivery of.
MIL-C-39029/1 - Contacts, Electric, Pin, Crimp Type, Terminal Junction Systems.
MIL-C-45662 - Calibration System Requirements.
MIL-I-81023 - Inductor, 28 V. D. C. Laboratory Test, General Specification for.
MS25196 - Seal, Bushing, External.

STANDARDS

FEDERAL

FED-STD-406 - Plastics: Methods of Testing.

MILITARY

MIL-STD-105 - Sampling Procedures and Tables for Inspection by Attributes.
MIL-STD-202 - Test Methods for Electronic and Electrical Component Parts.
MIL-STD-454 - Standard, General Requirements for Electronic Equipment.
MIL-STD-1285 - Marking of Electrical and Electronic Parts.
MIL-STD-1549 - Common Termination System for Electrical and Electronic Parts.

For applicable switch MS's covered by this specification, see supplement 1.

(Copies of specifications, standards, drawings, and publications required by contractors in connection with specific procurement functions should be obtained from the procuring activity or as directed by the contracting officer.)

2.2 Other publications. The following document forms a part of this specification to the extent specified herein. Unless otherwise indicated, the issue in effect on date of invitation for bids or request for proposal shall apply.

National Bureau of Standards

Handbook H28 - Screw-Thread Standards for Federal Services.

(Application for copies should be addressed to the Superintendent of Documents, Government Printing Office, Washington, D.C. 20402)

(Technical society and technical association specifications and standards are available for reference from libraries. They are also distributed among technical groups and using Federal agencies.)

3. REQUIREMENTS

3.1 Detail requirements for individual types of switches. Detail requirements applicable to individual types of switches shall be as specified in the applicable MS. In the event of any conflict between the requirements of this specification and the MS, the latter shall govern (see 6.2).

3.2 Switch catagories. Switches furnished under this specification shall be category I and II as defined in 3.2.1 and 3.2.2, respectively.

3.2.1 Category I switches. Switches completely defined by a MS military standard (see 3.1).

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

3.2.2 Category II switches (see 6.2.2). Category II switches are the same as category I switches except for minor differences such as termination, configuration, operating characteristics, and minor actuator variations that do not change the basic design or construction of the qualified switch. Category II switches shall be procured from a source listed on the qualified products list for the particular similar product in category I. Category II switches are nonstandard.

3.3 Qualification. Category I switches furnished under this specification shall be products which are qualified for listing on the applicable qualified products list at the time set for opening of bids.

3.4 Material. Material shall be as specified herein unless otherwise approved by the preparing activity. When a definite material is not specified, a suitable material shall be used which enables the switches to conform to the performance requirements of this specification. Reclaimed materials shall be utilized to the maximum extent possible. Acceptance or approval of any constituent material shall not be construed as a guaranty of the acceptance of the finished product.

3.4.1 Metals. All metal parts shall be of corrosion-resistant material, or shall be suitably protected to resist corrosion Paint is not acceptable for corrosion protection. Ferrous material shall not be used for current-carrying parts.

3.4.1.1 Dissimilar metals. When dissimilar metals are used in intimate contact with each other, protection against electrolysis and corrosion shall be provided. The use of dissimilar metals which, in contact, tend toward active electrolytic corrosion (particularly brass, copper, or steel used in contact with aluminum or aluminum alloy) is not acceptable. However, metal plating or metal spraying of dissimilar base metals to provide similar or suitable abutting surfaces is permitted The use of dissimilar metals separated by a suitable insulating material is also permitted. Dissimilar metals and compatible couples are defined in 6.9 through 6.9.4 inclusive, and table V.

3.4.2 Plastic materials Unless otherwise specified, (see 3.1), molded plastic material shall conform to MIL-M-14, and laminated plastic material shall conform to MIL-P-997, MIL-P-18177, or MIL-P-15037, however, stacked laminations shall not be used for the switch body. Other types of plastic materials may be used provided the manufacturer submits acceptable evidence of performance to the preparing activity during the qualification test program on the submitted product

3.4.2.1 Fungus-resistance. All material shall be inert or fungus resistant in accordance with requirement 4 of MIL-STD-454

3.4.3 Elastomer seals The material for all elastomer seals shall be silicone rubber in accordance with ZZ-R-765 Other types of silicone rubber may be used provided the manufacturer submits acceptable evidence of performance to the preparing activity during the qualification test program on the submitted product.

3.5 Design and construction The switches shall be of the design, construction, and physical dimensions specified (see 3.1 and 3.2). The switching action shall be such that the speed of the moving contacts is relatively independent of the actuating mechanism and that once contact movement has started, the motion cannot be stopped before the switching action is completed. Means shall be provided to impart direct, positive breaking between the operating lever and the contact member so that positive opening or closing of the contacts by the operating lever can be effected through a direct mechanical linkage between the movable contact member and the operating lever of the switch.

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

3.5.1 Actuating lever. The actuating lever shall be metal, shall have a lusterless finish and shall be insulated from all current-carrying parts.

3.5.2 Attitude. Switches shall be constructed so as to assure proper operation when mounted in any position.

3.5.3 Terminals. Terminals shall be as specified (see 3.1). Only the number of terminals required to accomplish the circuit characteristic shall be furnished.

3.5.3.1 Solderable terminals. Solderable terminals shall be treated to facilitate soldering. Silver plating shall not be used as the external coating. When gold plating is used because the terminals are integral with the gold contacts, its thickness shall be a minimum of 30 millionths of an inch and a maximum of 100 millionths of an inch. Terminals shall be designed so that wires can be mechanically secured prior to soldering. Terminals may be tapped or drilled after coating.

3.5.3.2 Screw terminals. Screw terminals shall be provided with the hardware specified (see 3.1 and the appendix herein).

3.5.3.3 Integrated wire termination Switches with integrated wire termination shall be designed in accordance with MIL-STD-1549.

3.5.4 Mounting bushing. The mounting bushing shall be as specified (see 3.1). The bushing shall be provided with a seal between the toggle lever and the switching mechanism. The body of the elastomer seal shall not protrude from the top of the mounting bushing with the exception of the tapered joint or meniscus where the seal joins the toggle lever, which may be permitted to exceed the height of the mounting bushing, but not interfere with operation of toggle lever.

3.5.5 Hardware Unless otherwise specified (see 3.1), all hardware mounting and terminal, shall be supplied in a separate package and packaged with the switch. When hardware is specified not to be supplied, the QPL source may mark these switches with the appropriate MS part number.

3.5.5.1 Mounting hardware. The mounting hardware shall be as specified (see 3.1).

3.5.5.2 Terminal hardware. The terminal hardware shall be as specified (see 3.1).

3.5.6 Antirotational means. All switches shall be designed to have an antirotational mounting means which shall be as specified (see 3.1).

3.5.7 Screw threads. Screw threads on external threaded parts shall be in accordance with Handbook H28 Threading of nonmetallic parts shall not be permitted Terminal thread engagement shall be at least two full threads.

3.5.8 Solder. Where soldering is employed, only noncorrosive fluxes shall be used. Soldering shall be in accordance with MIL-STD-454, Requirement 5. Solder shall not be used on the interior of switches with solderable external contacts

3.5.9 Weight. Weight shall be as specified (see 3.1).

3.6 Performance.

3.6.1 Solderability (applicable to solderable terminals). When switches are tested as specified in 4.8.2, 95 percent of the total length of fillet between the standard wrap wire and the terminal shall be tangent to the surface of the terminal being tested. There shall be no pinholes or voids. A ragged or interrupted line at the point of tangency between the fillet and the terminal under test shall be considered a failure. At the conclusion of the test, there shall be no fracture, loosening of parts or any other mechanical failure

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

3.6.2 Resistance to soldering heat (applicable to solderable terminals). When switches are tested as specified in 4.8.3, the switches shall remain operable. When opened, there shall be no internal deformation or damage.

3.6.3 Switching characteristics. When switches are tested as specified in 4.8.4, they shall operate as specified (see 3.1).

3.6.4 Strength of terminals. When switches are tested as specified in 4.8.5, there shall be no breakage, loosening, or rotating of terminals, and no damage to the switch body.

3.6.5 Strength of actuating-lever pivot and lever stop. When switches are tested as specified in 4.8.6, there shall be no malfunction damage, breakage, or short circuit; switches shall operate mechanically and electrically.

3.6.6 Strength of mounting bushing. When switches are tested as specified in 4.8.7, there shall be no loosening of the mounting bushing or other mechanical damage.

3.6.7 Mechanical endurance. When switches are tested as specified in 4.8.8, there shall be no deterioration of the toggle seal, mechanical breakage, or malfunction. Circuitry and degree of toggle lever movement shall be as specified (see 3.1). For momentary switches, return from the actuated position shall be caused solely by the internal mechanism of the switch

3.6.8 Contact bounce (when specified, see 3.1) When switches are tested as specified in 4.8.9, the contact bounce shall not exceed the value specified (see 3.1).

3.6.9 Contact voltage drop. When switches are tested as specified in 4.8.10, the contact voltage drop shall not exceed 1 millivolt

3.6.10 Dielectric withstanding voltage When switches are tested as specified in 4.8.11, the switches shall withstand the application of the specified voltages without arcing, flashover, breakdown of insulation, or damage, there shall be no momentary flashover or leakage in excess of 500 microamperes.

3.6.11 Electrical overload, endurance, life, low level dry circuit and intermediate current switching, and temperature rise When switches are tested as specified in 4.8.12, each pair of switch contacts under test shall open and close the circuit in proper sequence during each cycle of the switch actuating member. There shall be no external evidence of malfunction or damage during or after the test, and any blown fuse or tripped circuit breaker shall constitute failure. When switches are tested as specified in 4.8.12.6, the temperature rise of the switch terminals shall not exceed 50°C At the conclusion of the test, the switch shall be electrically and mechanically operable while controlling the test load, at the test environment and at room conditions. Electrical tolerances are as follows

Voltage	±5 percent for 28V, 125V, and 250V, dc. ±7 percent for 125V, and 250V, ac.
Frequency:	±5 percent.
Current:	±5 percent.

3.6.12 Short circuit closure When switches are tested as specified in 4.8.13, the switch contacts under test shall open after each closure operation, and there shall be no mechanical failure

3.6.13 Shock When switches are tested as specified in 4.8.14, the opening or closing of contacts shall not exceed 10 microseconds for method I (see 4.8.14.1) and 20 milliseconds for method II (see 4.8.14.2)

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

3.6.14 Vibration, high frequency. When switches are tested as specified in 4.8.15, there shall be no separation of closed contacts or closure of open contacts having a duration exceeding 10 microseconds. There shall be no evidence of damage.

3.6.15 Salt spray. When switches are tested as specified in 4.8.16, there shall be no warping, cracking, corrosion which exposes base material, or other damage, and the specified cycling shall be completed without failure. After the test, the mounting hardware shall be readily removable.

3.6.16 Moisture resistance. When switches are tested as specified in 4.8.17, there shall be no electrical failures, or breaking, spalling, cracking, or loosening of terminals.

3.6.17 Toggle ice. When switches are tested as specified in 4.8.18, there shall be no mechanical damage to the toggle seal or to the switch.

3.6.18 Sand and dust. When switches are tested as specified in 4.8.19, they shall be electrically and mechanically operable as evidenced by ability to control a pilot-lamp circuit.

3.6.19 Thermal shock. When switches are tested as specified in 4.8.20, there shall be no mechanical or electrical damage, or loosening of rivets or other fastening devices, and there shall be electrical continuity between closed contacts only.

3.6.20 Sealing

3.6.20.1 Toggle seal (water) (applicable to toggle sealed switches only). When the seal is tested as specified in 4.8.21.1, water shall not enter the interior of the switch.

3.6.20.2 Environmental seal test (applicable to environmentally sealed switches only).

3.6.20.2.1 Temperature cycling submersion (applicable for qualification and group B tests only. When switches are tested as specified in 4.8.21.2.1, there shall be no mechanical or electrical failures, and they shall meet the requirement for contact voltage drop (see 3.6.9) and dielectric withstanding voltage (see 3.6.10).

3.6.20.2.2 Leakage test mass spectrometer (applicable for group A tests only). When switches are tested as specified in 4.8.21.2.2, unless otherwise specified, the leakage rate shall not exceed 30×10^{-5} standard atmospheric cubic centimeters per second (atm cm^3/s)

3.6.21 Explosion (toggle seal switches only). When switches are tested as specified in 4.8.22, there shall be no explosion within the test chamber whether or not explosion occurs within the switch.

3.6.22 Flammability. When switches are tested as specified in 4.8.23, plastic materials used in all external switch parts and enclosures shall be self-extinguishing.

Check the source to verify that this is the current version before use.

3.7 Marking.

3.7.1 Identification of product. Switches shall be marked in accordance with MIL-STD-1285 as follows.

a. MS military standard part number (category I only).
b. Manufacturer's part number (category II).
c. Manufacturer's name, trademark or source code.
d. Date code.
e. Switch positions (on-off, etc.).
f. Terminal identification (when specified).

3.7.2 Terminal identification. When specified (see 3.1), terminals shall be permanently marked in accordance with figure 1 by either raised or depressed marking. Terminal marking by ink stamping on the side of the switch case is permissible if specified (see 3.1).

3.8 Workmanship Switches shall be processed in such a manner to be free from cracked or displaced parts, sharp edges, burrs and other defects which will affect life, serviceability, or appearance.

4. QUALITY ASSURANCE PROVISIONS

4.1 Responsibility for inspection Unless otherwise specified in the contract, the contractor is responsible for the performance of all inspection requirements as specified herein. Except as otherwise specified in the contract, the contractor may use his own or any other facilities suitable for the performance of the inspection requirements specified herein, unless disapproved by the Government. The Government reserves the right to perform any of the inspections set forth in the specification where such inspections are deemed necessary to assure supplies and services conform to prescribed requirements.

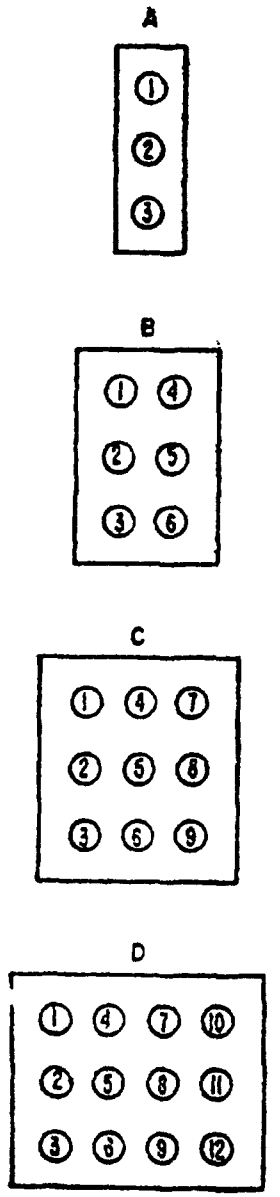

4.1 1 Test equipment and inspection facilities Test and measuring equipment and inspection facilities of sufficient accuracy, quality, and quantity to permit performance of the required inspection shall be established and maintained by the contractor The establishment and maintenance of a calibration system to control the accuracy of the measuring and test equipment shall be in accordance with MIL-C-45662.

4.2 Classification of inspection The examination and testing of switches shall be classified as follows

a Materials inspection (see 4.3).
b. Qualification inspection (see 4.5)
c Inspection requirements for category II switches (see 4 6)
d Quality conformance inspection (see 4 7).

4.3 Materials inspection Materials inspection shall consist of certification supported by verifying data that the materials listed in table I used in fabricating the switches, are in accordance with the applicable referenced specifications or requirements prior to such fabrication, or shall state whether other materials are used With the qualification test report, the manufacturer shall submit a cross-reference list of the switch parts and the materials used to fabricate those parts.

TABLE I. Materials inspection.

Material	Requirement paragraph	Applicable specification
Plastic	3.4.2	MIL-M-14 MIL-P-997 MIL-P-15037 MIL-P-18177 FED-STD-406
Fungus	3.4.2.1	MIL-STD-454
Rubber	3.4.3	ZZ-R-765

4.4 Inspection conditions. Unless otherwise specified herein, all inspections shall be performed in accordance with the test conditions specified in the "GENERAL REQUIREMENTS" of MIL-STD-202.

4.5 Qualification inspection (category I switches, see 3.1 and 3.3). Qualification inspection shall be performed at a laboratory acceptable to the Government (see 6.3) on sample units produced with equipment and procedures normally used in production.

4.5.1 Sample size. The number of switches to be subjected to qualification inspection shall be as specified in table II and the appendix to this specification.

4.5.2 Inspection routine. The sample shall be subjected to the inspections specified in table II, in the order shown.

4.5.3 Failures. One or more failures shall be cause for refusal to grant qualification approval.

4.5.4 Retention of qualification. To retain qualification, the contractor shall forward a report at 12- or 36-month intervals to the qualifying activity. The preparing activity shall establish the initial reporting date. The report shall consist of:

a. A summary of the results of the tests performed for inspection of product for delivery, group A, indicating as a minimum the number of lots that have passed and the number that have failed. The results of tests of all reworked lots shall be identified and accounted for.
b. The results of tests performed for periodic inspection, group B, including the number and mode of failures. The test report shall include results of all periodic inspection tests performed and completed during the reporting period. If the test results indicate nonconformance with specification requirements, and corrective action acceptable to the qualifying activity has not been taken, action may be taken to remove the failing product from the qualified products list.

Failure to submit the report within 30 days after the end of each reporting period may result in loss of qualification for the product. In addition to the periodic submission of inspection data, the contractor shall immediately notify the qualifying activity at any time during the reporting period that the inspection data indicates failure of the qualified product to meet the requirements of this specification.

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

In the event that no production occurred during the reporting period, a report shall be submitted certifying that the company still has the capabilities and facilities necessary to produce the item. If during 2 consecutive reporting periods there has been no production, the manufacturer may be required, at the discretion of the qualifying activity, to submit the basic switches covered by the applicable MS (see table VI) to testing in accordance with the qualification inspection requirements.

4.5.5 Test data. All test data shall be submitted in triplicate.

4.6 Inspection requirements for category II switches. Inspection requirements shall be performed by the contractor, after award of contract and prior to production, in accordance with the ordering data (see 6.2.2 and 6.2.3).

4.6.1 Category II switches Additional tests may be required to verify the deviations.

4.7 Quality-conformance inspection

4.7.1 Inspection of product for delivery Inspection of product for delivery shall consist of group A inspection

4.7.1.1 Inspection lot. An inspection lot shall consist of all switches that appear on the same MS military standard or military specification sheet and that are offered for delivery at one time Momentary action switches shall form a separate lot.

4.7.1.2 Group A inspection. Group A inspection shall consist of the inspections specified in table III in the order shown.

4 7.1.3 Sampling plan. Statistical sampling and inspection shall be in accordance with MIL-STD-105, for general inspection level II. Examination of product shall be limited to marking and workmanship. At the option of the contractor, in-process inspection may be used to meet the AQL requirements. All of the contractors in-process control data on these tests shall be made available to the Government upon request.

TABLE III. Group A inspection

Inspection	Requirement paragraph	Test paragraph	Inspection AQL	
			Major	Minor
Sealing (as applicable) - - -	3 6 20 2 2	4.8.21.2.2	1.0	---
Examination of produce - - -	3.1	4.8.1	1.0	4.0
Switching characteristics -	3.6.3	4.8.4	1.0	---
Dielectric withstanding voltage - - - - - - - - -	3.6.10	4.8.11		
Contact voltage drop - - - -	3.6 9	4.8.10		

4.7 1.4 Rejected lots If an inspection lot is rejected, the contractor may withdraw the lot, rework it to correct the defects, or screen out the defective units, as applicable, and reinspect Such lots shall be kept separate from new lots and shall be clearly identified as reinspected lots Rejected lots shall be reinspected using tightened inspection

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

4.7.2 Periodic inspection. Periodic inspection shall consist of group B. Except where the results of these inspections show noncompliance with the applicable requirements (see 6.4), delivery of products which have passed group A shall not be delayed pending the results of these periodic inspections.

4.7.2.1 Group B inspection. Group B inspection shall consist of the inspections specified in table II, in the order shown.

4.7.2.1.1 Sampling plan. The sampling plan and test procedure shall be as specified in the appendix to this specification. Group B inspection shall be completed within 1 year after initial qualification and within each 3-year period thereafter. A manufacturer's normal quality control tests, production tests, environmental tests, and so forth, may be used to fulfill all or part of group B inspection, however all of group B inspection shall be completed as specified. Data used may be accumulated within the previous 24 months.

4.7.2.1.2 Disposition of sample units. Sample units subject to group B inspection shall be forwarded to the preparing activity.

4.7.4 Inspection of packaging. Sample packages and packs and the inspection of the preservation-packaging, packing, and marking for shipment and storage shall be in accordance with the requirements of section 5.

4.8 Methods of inspection.

4.8.1 Examination of product. Switches shall be examined to verify that the design, construction, marking, and workmanship are in accordance with the applicable requirements. Only two of the sample units shall be inspected for compliance with physical dimensions. This inspection shall be performed before any other test is performed on the sample units (see 3.1, 3.4, and 3.5).

4.8.2 Solderability (applicable to solderable terminals, see 3.6.1). Switches shall be tested in accordance with method 208 of MIL-STD-202. The following details and exceptions shall apply:

a. Number of terminals to be tested - A minimum of one terminal of a closed contact per switch.
b. Depth of immersion in molten solder - Terminals shall be immersed to the maximum extent possible.
c. Examination of terminals - Method for evaluation of lugs and tabs shall apply.
d. Dipping machine - Need not be used.

4.8.3 Resistance to soldering heat (applicable to solderable terminals, see 3.6.2). Switches shall be tested in accordance with method 210 of MIL-STD-202. The following details shall apply

a. Number of terminals to be tested - A minimum of one terminal of a closed contact per switch.
b. Depth of immersion in molten solder - Terminals shall be immersed to the maximum extent possible
c. Test condition letter - B
d. Cooling time prior to final examinations and measurements - Not applicable.
e. Examinations and measurements.
   1. Before - None.
   2. After - Switches shall be operable and there shall be no evidence of internal deformation or other damage when opened at the conclusion of the test sequence.

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

4.8.4 Switching characteristics (see 3.6.3). Switching action (e.g., on-off, on-off-on, etc) and circuitry shall be inspected for compliance with the applicable requirements (see 3.1). Circuit continuity shall be inspected using a 6-volt source and a maximum load of 100 milliamperes.

4.8.5 Strength of terminals (see 3.6.4). When mounted in accordance with 4.8.7, terminals shall be tested as specified herein. All terminals are to be tested, but any one terminal shall be tested in one direction only.

4.8.5.1 Solderable terminals. Solderable terminals shall be tested in accordance with method 211 of MIL-STD-202. The following details and exceptions shall apply:

a. Test condition letter - A.
b. Applied force - 5 pounds.
c. Direction of applied force:
   1. With the terminals vertical and pointing downward, the specified pull shall be applied directly downward.
   2. With the terminals horizontal, the specified pull shall be applied directly downward.
   3. With the terminal horizontal and rotated 90 degrees about their horizontal axis from the position in c.2, the specified pull shall be applied directly downward.

4.8.5.2 Screw-lug terminals Screw-lug terminals shall be tested in accordance with method 211 of MIL-STD-202. The following details and exceptions shall apply:

a. Test condition letter - A
b. Applied force - 25 pounds.
c. Direction of applied force
   1. Parallel to the axis of the terminal screw.
   2. Perpendicular to the axis of the terminal screw.

4.8.5.3 Integrated wire terminals. Integrated wire terminals shall be subjected to a 5-pound pull for 5 to 10 seconds in the following directions:

a. With the long dimension of the terminal contact vertical, and the contact opening facing downward, specified pull shall be applied directly downward.
b. With the long dimension of the terminal contact horizontal, the specified pull shall be applied directly downward.
c. Two outboard terminals on each switch shall be tested. However, a terminal shall be tested only once in one direction.

4.8.5.4 Screw thread terminals Screw-thread terminals shall be tested in accordance with method 211 of MIL-STD-202, test condition letter E. The torque shall be applied in the direction which will tighten the screw.

4.8.6 Strength of actuating-lever pivot and lever stop (see 3.6.5). The switch shall operate mechanically and electrically at a maximum load of 6 volts dc, 100 milliamperes after the following tests

a A 25-pound load except for b. below, shall be applied to the tip of the actuating lever for 1-minute under each of the following conditions
   1. Perpendicular to the lever axis and parallel to the line of lever travel at each end position of the lever For lever-lock types, the test shall be conducted at each fixed position of the lever
   2 Perpendicular to the lever axis and perpendicular to the line of travel at each lever position

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

3. Coaxial with the lever axis away from the lever pivot, throughout the entire range of lever travel
4. Coaxial with the lever axis and toward the lever pivot, throughout the entire range of lever travel. For lever-lock types, this test is only applicable to those changes in lever position which may be accomplished without lifting the lever from its detent position.

b. For lever-lock types with external stops, a 35-pound load shall be used for test a.1. above.

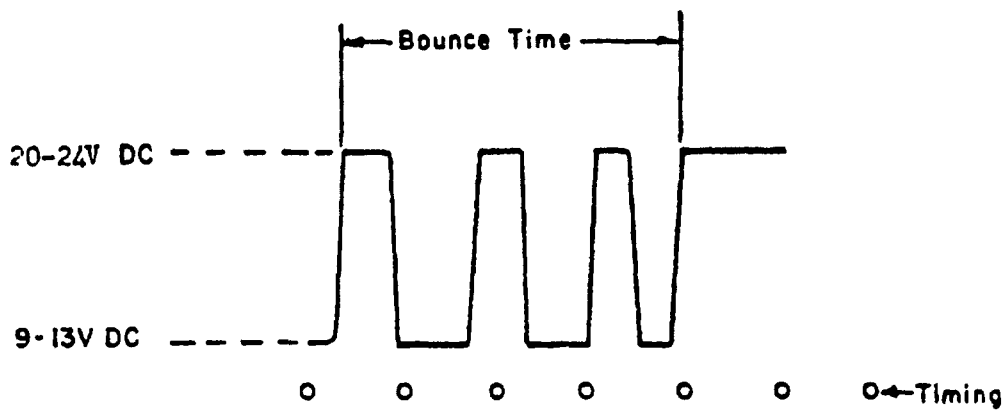

4.8.7 Strength of mounting bushing (see 3.6.6). Bushing mounted switches shall be mounted on a metal panel using normal mounting means with the hardware specified on the applicable MS. A torque of 65 pound-inches shall be applied to the mounting nut on switches with 15/32-inch diameter bushings or larger and a torque of 15 pound-inches shall be applied to the mounting nut on smaller size bushings. If the unit has provision for an antirotational device, the mounted switch body shall be subjected to a torque of 5-pound-inches, with the nonturn device mounted on the switch in the normal manner.

4.8.8 Mechanical endurance (see 3.6.7). Unless otherwise specified (see 3.1), the switches shall be subjected to 40,000 cycles of operation. The following details shall apply (a. through g. for environmentally sealed switches only; b. through g. for toggle sealed switches):

a. Unless otherwise specified (see 3.1), switches shall be maintained at a temperature of -55° ±2°C for a period of at least 2 hours with the contacts open. At the conclusion of this period all "on" positions shall be tested using a pilot circuit with parameters of 28 Vdc maximum and 100 milliamperes maximum. Failure to turn "on" on the first operation shall constitute failure.
b. Unless otherwise specified (see 3.1), one half the cycles shall be at -55° ±2°C while the other half of the cycles shall be at +71° ±2°C.
c. A cycle shall be the movement of the toggle lever from one extreme position to the other extreme position and return to the original position.
d. Cycling rate shall be 10 to 18 cycles per minute (cpm). At the manufacturer's option, a faster rate of cycling up to 60 cpm may be used
e. Lever-lock switch handles shall also be tested for 20,000 actuations, at room ambient conditions, by pulling the lever to its fully extended position and then permitting it to return to its fully retracted position without operation of the switches, at a maximum of 60 cpm.
f. With the toggle lever in the unlocked position, lever-lock switches shall be tested with the toggle lever moving through all positions.
g. Momentary switches shall return from their momentary position(s) solely by the internal mechanism of the switch.

4.8.9 Contact bounce (when specified, see 3.6.8). Photographic records of contact bounce shall be submitted for qualification and group B test approval. The duration of contact bounce shall be taken as the average of five consecutive readings on each contact pair. The contact bounce shall be determined by the use of the test circuit on figure 2 and bounce time shall be measured as shown on figure 3. Caution should be observed to be sure that the photographic records include not only the initial bounce but any secondary bounce if it exists.

Check the source to verify that this is the current version before use.

4.8.10 Contact voltage drop (see 3.6.9). Switches shall be tested in accordance with method 307 of MIL-STD-202; the following details shall apply:

a. Measurements shall be made between the terminals of the contacts of the same pole forming a switching circuit. Measurements shall be made for each pole of multipole switches.
b. Test current - 100 milliamperes.
c. Open-circuit voltage - 2 to 6 volts dc.
d. Number of activations prior to measurement - 3.
e. Number of test activations - 3.
f. Number of measurements per activation - 1.

4.8.11 Dielectric withstanding voltage (see 3.6.10). Switches shall be tested in accordance with 4.8.11.1 and 4.8.11.2, to which the following details and exceptions shall apply:

a. Method 301 of MIL-STD-202 shall be used.
b. Duration of application of test voltage - One minute minimum for qualification and group B; 2 to 5 seconds for other tests.
c. Points of application:
   1. Between mutually insulated parts (not applicable after electrical endurance tests).
   2. Between current-carrying parts and all noncommon exposed or grounded metal parts.
d. Measurements shall be made for each lever position.
e. Leakage or failure - Momentary flashover or leakage in excess of 500 microamperes shall constitute failure.
f Group A test shall be conducted at room ambient conditions only, and the potential shall be 1,800 Vrms. For switches rated above 250 volts, the minimum test voltage shall be 240 percent of rated voltage plus 1,200 volts.
g. Examination after test - Switches shall be examined for evidence of arcing, flashover, breakdown of insulation or damage.

4.8.11.1 At atmospheric pressure. The following details shall apply.

a. Test voltage - 1,500 Vrms minimum. Switches rated above 250 volts shall be subjected to a minimum voltage of 1,000 Vrms plus twice the rated voltage.
b. 750 Vrms minimum shall be used after electrical endurance tests between current-carrying parts and all noncommon exposed or grounded metal parts. Duration of application of test voltage - 1 minute minimum.
c. In lieu of voltage and time in b. above, use 900 Vrms for 2 - 5 seconds.

4.8.11.2 At reduced barometric pressure. The following details shall apply·

a. Method 105 of MIL-STD-202 at 65,000 feet.
b. Test voltage - 500 Vrms minimum. Switches rated above 250 volt be subjected to a minimum voltage of 500 Vrms plus twice the rated voltage.

Check the source to verify that this is the current version before use.

4.8.12 Electrical overload, endurance, life, low level and intermediate current switching, and temperature rise (see 3 6 11). The following conditions and exceptions shall apply

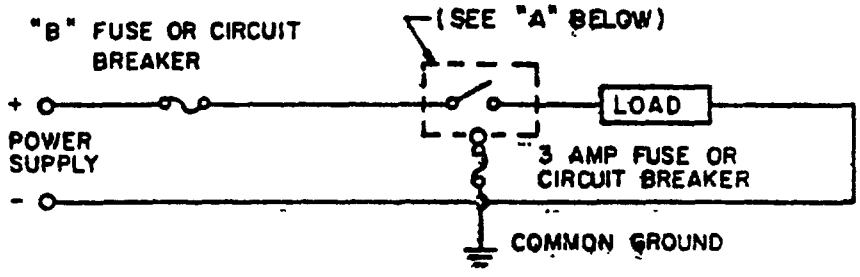

a. Test switches shall be mounted by their normal mounting means against a metal plate. Insulators shall not be interposed between the switch case and the metal plate or between the metal actuator of the actuating machine and the switch toggle.
b. The metal mounting plate, one side of the power supply, and the metal actuator of the actuating machine shall all be connected to a common ground through a 3 ampere fuse per MIL-F-15160/2 characteristic A (F02A, 250V, 3A) (see figure 3). For direct current, the negative side of the power supply shall be grounded. The test switch shall be connected to the power source and test load using a 1/2 to 6-foot length of wire as specified in table IV.
c. The test voltage magnitude and electrical frequency shall be maintained within the tolerances specified when the test voltage is measured at the switch terminals. Monitor circuits shall be provided to detect failure or any pair of contacts to open or close their circuit in proper sequence and shall not shunt switch contacts or inductive components in the test circuit.
d. One throw of each pole of the switch shall be connected to an independent test circuit meeting the specified conditions. Multipole switches are to be tested with a load per pole. All poles shall be connected to the same supply line, as shown in figure 3. For double-throw switches, one half the switches shall be tested with the load circuit connected to one throw and the remaining half of the switches shall be tested with the load circuit connected to the other throw The load switched by a switch contact shall be the same throughout the duration of the cycling.
e. Switches shall be actuated at a frequency of 10 to 18 cpm and at a maximum velocity of 5 inches per second by a power driven actuator.
f. During the overload test, the closed time of the switch shall be 0.5 second minimum during each cycle of operation. Unless otherwise specified (see 3.1), the endurance test duty cycle shall be a minimum of 25 percent on.
g. Switches shall be subjected to the overload, and electrical tests specified in table II.
h. Overload and endurance tests shall be performed on the same pair of contacts using the same voltage and electrical frequency for both tests
i. Momentary switches shall return from their momentary position(s) solely by the internal mechanism of the switch

4.8.12.1 Overload circuit. The switch shall make and break 150 percent of rated resistive load at the applicable voltage and electrical frequency for 50 cycles of operation at room conditions.

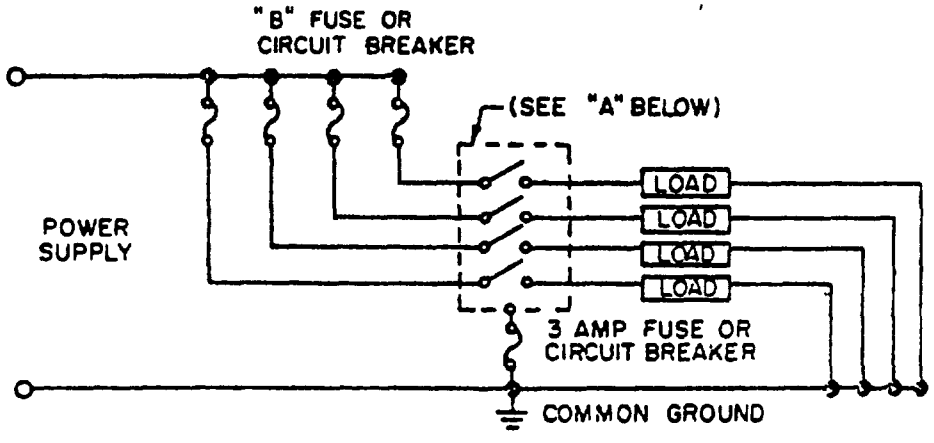

TABLE IV. Wire size and circuit breaker or fuse designations.

Amperes	MIL-W-5086 wire size	Circuit breaker or fuse
3.0 or less	20	The size of the circuit breaker or fuse shall be equivalent to the test current Fuses shall conform to MIL-F-15160 Circuit Breakers shall conform to MIL-C-5809
5.0	20	
7.5	18	
10.0	18	
15.0	18	
18 0	16

Check the source to verify that this is the current version before use.

4.8.12.2 Resistive load (dc and ac). One half of the switches for test shall make and break the rated resistive load for 20,000 operating cycles while at room pressure and a temperature of 71° ±2°C (or other temperature as specified). Unless otherwise specified (see 3.1), the other half of the switches for test shall make and break the rated resistive load for 20,000 operating cycles while at room temperature and a pressure equivalent to 65,000 feet altitude.

4.8.12.3 Inductive load (dc and ac). Unless otherwise specified (see 3.1), one half of the switches shall make and break the rated inductive load for 20,000 operating cycles while at a pressure equivalent to 65,000 feet altitude and at room temperature. The other half shall make and break rated inductive load for 20,000 operating cycles at room ambient. The dc inductive current shall be in accordance with MIL-I-81023. The ac inductive circuit shall have a power factor of 75-80 percent.

4.8.12.4 Lamp-load circuit (ac and dc). Switches shall be subjected to 20,000 operating cycles when wired into a circuit having rated steady state lamp-load current at the applicable rated voltage. For ac lamp loads, only tungsten filament lamps having a wattage not exceeding 200 watts at the specified voltage shall be used to make up the load. For dc lamp loads, tungsten filament lamps having a nominal wattage of 25 to 50 watts at the specified voltage shall be used to make up the load. A minimum cooling period of 15 seconds shall be allowed between successive operations of the lamps. At the option of the manufacturer, a synthetic lamp load may be used for this test. The synthetic lamp load shall consist of making 10 times the rated lamp load and breaking the rated lamp load. The duration of the 10 times inrush current shall be 0.015 second, minimum.

4.8.12.5 Life, dry circuit, low-level and intermediate-current switching. Unless otherwise specified (see 3.1), single-pole switches shall be connected to the loads specified herein in the sequence shown. One pole of each multipole switch shall be connected to rated resistive load at 28 Vdc. The other poles shall be connected to the loads specified herein in the sequence shown. Contacts subjected to these tests shall not have been electrically loaded prior to these tests.

Circuit or pole no.	Loads
1	10 milliamperes resistive load at 30 mV.
2	5 percent rated resistive load at 28 Vdc.
3	3 percent rated inductive load at 28 Vdc.

The switches shall be operated for 20,000 operations on these loads at a rate of 10 to 12 operations per minute in an ambient temperature of 71° ±2°C.

4.8.12.6 Temperature rise. Each pole of the switch shall be connected in a circuit carrying the rated resistive endurance test current at any convenient ac or dc voltage. At the end of a 1-hour period the terminal temperature rise, at a point adjacent to the insulating medium, shall be determined by means of appropriate thermocouples consisting of No. 28-32 AWG iron-constantan. This test shall be performed on the same switch contacts previously subjected to the overload and electrical endurance test. During this test, switches shall be mounted 6 inches apart on a 1/16-inch thick steel panel 6 inches wide in still air.

4.8.13 Short circuit closure (see 3.6.12). The switch shall be inserted in a circuit calibrated to supply current equal to 60 times the rated resistive load at the lowest rated dc voltage specified (see 3.1). The switch shall be connected in series by 1-foot lengths of wire to a thermal-type circuit breaker or a fuse in accordance with figure 4 and table IV. The wire shall be as specified in MIL-W-5086 and table IV determined by the rated resistive load of the switch (see 3.1).

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

If the rated load of the switch does not coincide with a wire size, the next larger wire size shall be used. The terminals shall be in accordance with MIL-T-7928. The circuit breaker shall be in accordance with MIL-C-5809 and fuses shall be in accordance with MIL-F-15160, or equivalent. If the rated load of the switch does not coincide with a circuit breaker or fuse current rating, the next larger breaker or fuse size shall be employed. Calibration shall be made without the circuit breaker (or fuse), test switch, or switch leads in the circuit. The calibrated circuit shall be closed by the switch under test and, after the circuit breaker or fuse interrupts the circuit, the test switch shall be manually opened by means of the toggle lever. This procedure shall be repeated 10 times. After each closure, the operating lever shall be returned manually to the "off" position, and the switch contacts shall be checked for proper opening by any suitable continuity test method. The circuit breaker shall be reset or the fuse replaced after each closure. A minimum of 2 minutes shall elapse between successive closure operations of the test switch. For double-throw switches, one-half of the switches shall be tested in one position and the remaining half shall be tested in the other position. Only one pole of multiple pole switches need be tested.

4.8.14 Shock (see 3.6.13). Switches shall be tested in accordance with 4.8.14.1, or when specified (see 3.1) in accordance with 4.8.14.2.

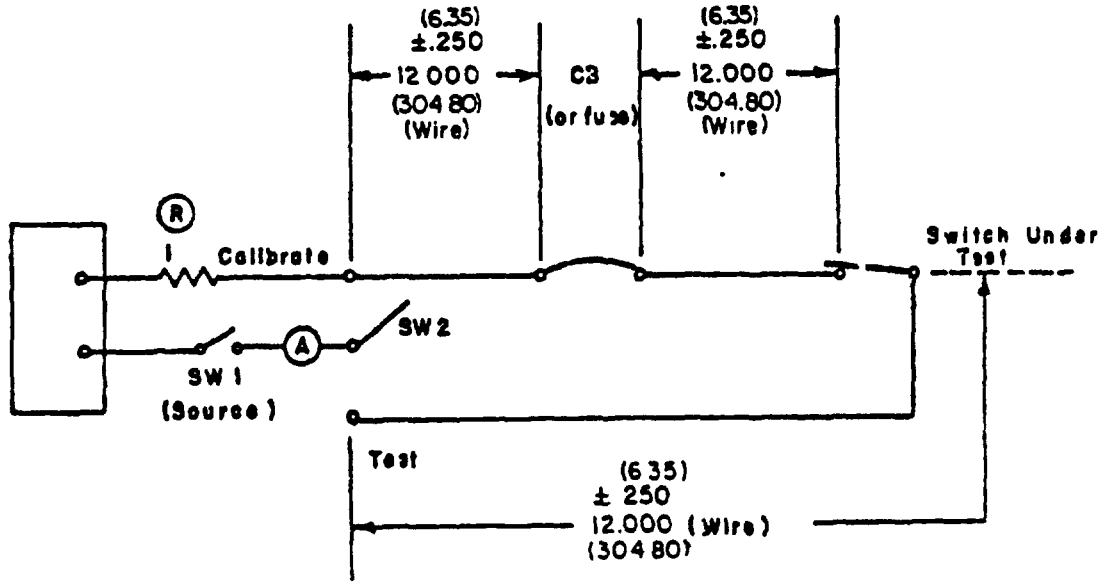

4.8.14.1 Method I. Switches shall be tested in accordance with method 213 of MIL-STD-202, test condition I. The following details and exceptions shall apply:

a. Contacts shall be monitored in accordance with method 310 of MIL-STD-202.
b. Switches shall be mounted using normal mounting means to a sufficient mass in each of its three perpendicular axes in turn. Half of the switches shall be tested in one lever position and the other half of the switches shall be tested in the alternate lever position.
c. Electrical load conditions - The electrical load shall consist of the monitor circuit only.
d. Measurements during shock - Switch contact stability shall be continuously monitored during shock. If more than one contact pair is being monitored simultaneously by one chatter indicator, open contact pairs shall be connected in parallel and closed contact pairs shall be connected in series during this test. In event of indication of a contact opening greater than specified, the test shall be modified by applying successive identical blows in the same plane to monitor contacts, switch by switch, to determine whether a switch is defective.
e. Measurements after shock - Switches shall be inspected for switching characteristics (see 4.8.4).
f. Examination after test - Switches shall be examined for evidence of broken, deformed, displaced, or loose parts.

4.8.14.2 Method II (when specified). Switches shall be tested in accordance with method 207 of MIL-STD-202. The following details and exceptions shall apply.

a. Mounting: Mounting shall be as specified in 4.8.14.1b.
b. Measurements during shock - Switch-contact stability shall be monitored simultaneously by one chatter indicator, open contact pairs shall be connected in parallel and closed contact pairs shall be connected in series during this test. In the event of indication of a contact opening greater than 20 milliseconds, the test shall be modified by applying successive identical blows in the same plane to monitor contacts, switch by switch, to determine which switches are defective.
c. Measurements after shock - Switches shall be inspected for switching characteristics (see 4.8.4).
d. Examination after test - Switches shall be examined for evidence of broken, deformed, displaced, or loose parts.

Check the source to verify that this is the current version before use.

4.8.15 Vibration, high frequency (see 3.6.14). Switches shall be tested in accordance with method 204 of MIL-STD-202. The following details and exceptions shall apply:

a. Contact chatter shall be monitored in accordance with method 310 of MIL-STD-202.
b. Test condition letter - D, except sweep cycle shall be performed two times in each of three mutually perpendicular directions.
c. Tests and measurements prior to vibration - Not applicable.
d. Mounting - Switches shall be rigidly mounted by their normal mounting means on a rigid metal panel. The mounting fixture shall be free from resonances over the test frequency range. Half of the switches shall be tested in one lever position and the other half of the switches shall be tested in the alternate lever position.
e. Electrical load conditions - The electrical load shall consist of the monitor circuit only.
f. Measurements during vibration - Switch contact stability shall be continuously monitored during vibration. If more than one contact pair is being monitored simultaneously, open contact pairs may be connected in parallel and closed contact pairs may be connected in series during this test. In the event of indication of a contact opening or closure greater than specified, the test may be modified so that switches may be individually tested to determine if a switch is defective. Switches shall be observed for critical resonant frequencies. Resonant endurance tests shall be conducted for 15-minute periods at each critical resonant frequency found. If a change in resonant frequency occurs during testing, the frequency of vibration shall be adjusted to follow the change.
g. Measurements after vibration - Switching characteristics (see 4.8.4).
h. Examination after test - Switches shall be examined for change in actuated position, and evidence of broken, deformed, displaced or loose parts.

4.8.16 Salt spray (see 3.6.15). Switches shall be tested in accordance with method 101, MIL-STD-202. The following details and exceptions shall apply:

a. Test condition A.
b. Treatment after test - Within 10 minutes after test, switches shall be washed for 5 minutes under running water not warmer than 37°C, accompanied by slight brushing, then dried for 6 hours in a force-draft oven at 50° to 60°C.
c. Following the drying period - the switches shall be examined for warping, cracking, or other damage. Environmentally sealed switches shall be subjected to 10 cycles of operation making and breaking the rated resistive current at the lowest rated dc voltage specified (see 3.1).

4.8.17 Moisture resistance (see 3.6.16). Switches shall be tested in accordance with method 106 of MIL-STD-202. The following details shall apply:

a. Mounting - By normal mounting means on a noncorrosive metal panel positioned 15 degrees from the vertical. One half of the switches shall be toggle mounted with toggle lever up and the other half with the toggle lever down. The mounting panel shall have appropriate mounting holes so that switches are at least 1 inch apart.
b. Polarization - During steps 1 to 6 inclusive, a dc potential of 100 volts shall be applied between current-carrying parts and panel. Negative polarity shall be applied to the panel. Switches shall be monitored for electrical failures, a switch with a leakage current in excess of 1 milliampere shall be considered a failure. Steps 7a and 7b are not applicable

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

c. Final measurements - Following a 24-hour period at room ambient conditions, switching characteristics shall be measured as specified in 4.8.4. Switches shall be examined for evidence of breaking, spalling, cracking, or loosening of terminals.
d. Water - Steam, distilled or de-ionized shall be used.

4.8.18 Toggle ice (see 3.6.17). The open end of the toggle sleeve shall be filled with water and the switch subjected to an ambient temperature of -55°C or below for a 1-hour period. Then while still at ambient temperature, the switch shall be operated, breaking the ice. This test shall be conducted with the toggle lever in each position. The switch shall then be examined for evidence of mechanical damage.

4.8.19 Sand and dust (3.6.18). Switches shall be tested in accordance with method 110 of MIL-STD-202. The following details and exception apply:

a. Delete steps 2 and 3.
b. Air velocity - 300 ±200 feet per minute. During the test, the switches shall be mechanically operated for 2,500 cycles. The cycling rate shall be 10 to 18 cycles of operation per minute. The switch shall then be tested for mechanical and electrical operation, using a pilot lamp circuit or equivalent.

4.8.20 Thermal shock (see 3.6.19). Switches shall be tested in accordance with method 107 of MIL-STD-202. The following details shall apply

a. Test condition - A
b. Measurements before and after cycling - Not applicable.
c. Examination after test - Switches shall be examined for mechanical and electrical damage, loosening of rivets or other fastening devices, and electrical continuity

4.8.21 Sealing (see 3.6.20).

4.8.21.1 Toggle seal (water) (applicable to toggle sealed switches only). Switches shall be tested in accordance with 4.8.21.1.1 or when specified (see 3.1), in accordance with 4.8.21.1.2.

4.8.21.1.1 Method I. The open end of the mounting sleeve shall be gradually subjected to water pressure of 6.5 ±0.5 pounds per square inch. While submerged, the switch shall be operated for 20,000 operations at a rate of 10 to 12 operations a minute. A panel seal in accordance with MS25196 should be used to seal the sleeve-panel opening during this test. Switches shall then be examined to determine if water has entered the interior of the switches.

4.8.21.1.2 Method II (when specified). Switches shall be subjected to a 0.5 inch $^{+0.25}_{-0}$ inch head of water above the top of the bushing. While subjected to the head of water, they shall be tested in the following sequence

a. 5 minutes static with the lever in any position
b. 5 complete normal operations
c. 5 minutes static with the lever in any position.

Switches shall then be examined to determine if water has entered their interiors.

4.8.21.2 Environmental seal test

4.8.21.2.1 Temperature cycling submersion (applicable for qualification and group B tests only) (see 3.6.20.2.1). The switches shall be completely submerged in ethylene glycol in accordance with MIL-F-9500, at a temperature of 71° ±2°C, unless otherwise specified (see 3.1), and each pole connected to a 0.1-ampere resistive load

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

at the specified dc power supply voltage(s). The switches shall then be operated at a rate of 10 to 12 operations per minute for 20,000 operations; switches shall be constantly monitored for proper contact action. At the end of the second hour, the temperature of the ethylene glycol shall be reduced to -18° ±2°C, and held at that temperature until the end of the fourth hour, at which time it shall be returned to 71° ±2°C. This 4-hour cycle shall be repeated throughout the test. The temperature change shall be completed within 10 minutes in each case. Switches shall be examined for mechanical and electrical failure. Immediately following the test, the switches shall be washed in clear water and dried by subjecting them to room ambient conditions for 4 hours. Switches shall then be subjected to the contact voltage drop test (see 4.8.10) and a dielectric withstanding voltage test of 1,000 volts (see 4.8.11).

4.8.21.2.2 Leakage test mass spectrometer (applicable for group A tests only (see 3.6.20.2.2). Switches shall be tested in accordance with method 112 of MIL-STD-202. The following details and exception shall apply:

a. Test condition C - Procedure III.
b. Leakage rate sensitivity 1 x 10^{-8} atmospheric cm^3/s during the exposure to helium atmosphere between the interior and exterior of the switches under test. Test conditions A and B for gross leak not applicable.

4.8.22 Explosion (toggle seal only) (see 3.6.21). Switches shall be tested in accordance with method 109 of MIL-STD-202. The following detail shall apply:

a. Mechanical and electrical load - Switches shall be operated at their maximum rated dc inductive current (see 3.1).

4.8.23 Flammability (see 3.6.22). Switches shall be tested in accordance with method III of MIL-STD-202. The following details and exceptions apply:

a. Specimens are mounted so axis of bushing is horizontal.
b. One-half of the specimens are to be tested with the keyway up; the other half shall have the keyway 90° from the up position
c. Specimens shall be tested without terminal hardware.
d. Direction of the flame - Horizontal.
e. The point of impingement of the applied flame - The backside of switch (opposite of toggle lever) as close to the middle as possible.
f. Allowable time for burning of visible flame on the specimen is

1. Miniatu. switch - 90 seconds.
2. Large switch - 60 seconds.

5. PACKAGING

5.1 Packaging requirements. The requirements for packaging shall be in accordance with MIL-S-28786.

6. NOTES

6.1 Intended use. Switches furnished under this specification are intended for use in circuits with ratings no lower than the life, low current level, dry circuit switching requirements of 3.6.11.

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

6.2 Ordering data. Procurement documents should specify the following:

6.2.1 Category I switches.

a. National Stock Number (NSN).
b. Switch, Toggle.
c. MS part number along with document number and date (see 3.1)
d. Basic document and date.
e. Amendments if applicable.
f. Levels of preservation-packaging, and packing.
g. Whether mounting and/or terminal hardware is not to be furnished.

6.2.2 Category II switches. (Available manufacturing test data showing compliance may be substituted as meeting these requirements at option of procuring activity. A copy of the drawing furnished under g. including the description of the variations from the specification sheet, shall be sent to the preparing activity as listed on the individual specification sheet Preparation and submission of data shall be in accordance with step II, MIL-STD-749, Preparation and Submission of Data for Approval of Nonstandard Electrical Parts).

a. National Stock Number (NSN).
b. Switch, Toggle.
c. MS number along with document number and date of similar category I switch.
d. Basic document and date and amendments, if applicable.
e Statement that switch is category II.
f. Manufacturers part number of modified switch.
g. Details of the variations from the MS military standard sheet
h. Inspection requirements - (To verify variations from category I switches).
   1. Tests to be performed (if any).
   2. The laboratory at which inspection is to be performed.
   3. Samples and submission of data, if other than that specified.
i. Levels of preservation-packaging, packing, and marking (see Section 5).

6.3 Qualification. With respect to products requiring qualification, awards will be made only for products which are at the time set for opening of bids, qualified for inclusion in the applicable Qualified Products List whether or not such products have actually been so listed by that date. The attention of the contractors is called to these requirements, and manufacturers are urged to arrange to have the products that they propose to offer to the Federal Government tested for qualification in order that they may be eligible to be awarded contracts for the product covered by this specification. The activity responsible for the Qualified Products List is the Department of the Air Force, Aeronautical Systems Division, Attn ENESS, Wright-Patterson Air Force Base, Ohio 45433, however, information pertaining to qualification of products may be obtained from Defense Electronics Supply Center (DESC-E), Dayton, Ohio 45444.

6.4 Noncompliance. If a sample fails to pass group B inspection, the manufacturer shall notify the qualifying activity and the cognizant inspection activity of such failure and take corrective action on the materials or processes, or both, as warranted, and on all units of product which can be corrected and which were manufactured under essentially the same conditions with essentially the same materials, processes, etc, and which are considered subject to the same failure. Acceptance and shipment

Source: https://assist.dla.mil -- Downloaded: 2026-10-17T11:34Z
Check the source to verify that this is the current version before use.

of the product shall be discontinued until corrective action, acceptable to the qualifying activity has been taken. After the corrective action has been taken, group B inspection shall be repeated on additional sample units (all inspection, or the inspection which the original sample failed, at the option of the qualifying activity). Group A inspection may be reinstituted; however, final acceptance and shipment shall be withheld until the group B inspection has shown that the corrective action was successful. In the event of failure after reinspection, information concerning the failure shall be furnished to the cognizant inspection activity and the qualifying activity.

6.5 Bushing and panel seals. Boots, when required, should be in accordance with MIL-B-5423. Panel seals, when required, should be in accordance with MS25196.

6.6 Switch guards. When switch guards are required, they should be in accordance with MIL-G-7703.

6.7 Switch, toggle, installation of. Toggle switches should be installed in accordance with MS33630.

6.8 Definitions.

6.8.1 Snap-action positive break. Snap-action positive break is a switch design in which the linkage between the actuator and movable contacts is a combination of a resilient linkage and direct mechanical linkage such that should the resilient member become fully compressed without moving the contacts, a direct mechanical linkage will override the resilient linkage to insure positive break.

6.8.2 Dry circuit. A dry circuit is an electrical circuit in which its current and voltage values are so small that when switch contacts are subjected to this electrical load, their contact resistance does not change.

6.9 Intermetallic contact. The finishing of metallic areas to be placed in intimate contact by assembly presents a special problem, since intermetallic contact of dissimilar metals results in electrolytic couples which promote corrosion through galvanic action. To provide the required corrosion protection, intermetallic couples are restricted to those permitted by table V. Table V shows metals and alloys (or plates) by groups which have common electromotive forces (EMF) within 0.05 volt when coupled with a saturated calomel electrode in sea-water at room ambient temperatures. All members of a group are considered as completely compatible, one with the other. Compatible couples between groups have been specified in table V based on a potential difference of 0.25 volt maximum. To simplify any arithmetic involved, table V shows, in addition to EMF against a calomel electrode, a derived "anodic index" with group 1 (gold, etc.) as 0 and group 18 (magnesium, etc.) as 175. Subtraction of a lower group anodic index gives the EMF difference in hundredths of a volt.

6.9.1 Groups. Table V sets up 18 primary groups. It may be noted that neither the metallurgical similarity or dissimilarity of metals is the parameter for selection of compatible couples. All members within a group, regardless of metallurgical similarity, are considered inherently nonsusceptible to galvanic action when coupled with any member within the group; for example, such dissimilar metals as platinum and gold. Similarly, such basically dissimilar alloys as austenitic stainless steel, silver-solder, and low brass (all members of group 5) are inherently nonsusceptible when coupled together.

6.9.2 Compatibility graphs. Permissible couple series are shown in table V by the graphs at the right. Members of groups connected by lines will form permissible couples. A 0 indicates the most cathode member of each series, a ● an anodic member, and the arrow indicates the anodic direction.

Check the source to verify that this is the current version before use.

TABLE V. Compatible couples (see 6.9) 1/

Group No.	Metallurgical category	EMF (volt)	Anodic index (0.01 v)	Compatible couples
1	Gold, solid and plated; gold-platinum alloys; wrought platinum (most cathodic)	+0.15	0	
2	Rhodium plated on silver-plated copper	+0.05	10	
3	Silver, solid or plated; high silver alloys	0	15	
4	Nickel, solid or plated; monel metal, high nickel-copper alloys	-0.15	30	
5	Copper, solid or plated; low brasses or bronzes; silver solder; German silver; high copper-nickel alloys; nickel-chromium alloys; austenitic corrosion-resistant steels	-0.20	35	
6	Commercial yellow brasses and bronzes	-0.25	40	
7	High brasses and bronzes; naval brass, Muntz metal	-0.30	45	
8	18 percent chromium type corrosion-resistant steels	-0.35	50	
9	Chromium, plated; tin, plated; 12 percent chromium type corrosion-resistant steels	-0.45	60	
10	Tin-plate; terneplate; tin-lead solder	-0.50	65	
11	Lead, solid or plated; high lead alloys	-0.55	70	
12	Aluminum, wrought alloys of the duralumin type	-0.60	75	
13	Iron, wrought, gray, or malleable; plain carbon and low alloy steels, armco iron	-0.70	85	
14	Aluminum, wrought alloys other than duralumin type; aluminum, case alloys of the silicon type	-0.75	90	
15	Aluminum, cast alloys other than silicon type; cadmium, plated and chromated	-0.80	95	
16	Hot-dip-zinc plate; galvanized steel	-1.05	120	
17	Zinc, wrought; zinc-base die-casting alloys; zinc, plated	-1.10	125	
18	Magnesium and magnesium-base alloys, cast or wrought (most anodic)	-1.60	175	

1/ Compatible couples - potential difference of 0.25 volt maximum between groups.

Check the source to verify that this is the current version before use.

6.9.3 Selection of compatible couples. Proper selection of metals in the design of equipment will result in fewer intermetallic contact problems. For example, for sheltered exposure, neither silver nor tin require protective finishes. However, since silver has an anodic index of 15 and tin 65, the EMF generated as a couple is 0.50 volt, which is not allowable by table V. In this case, other metals or plates will be required. It should be noted that, in intermetallic couples, the member with the higher anodic index is anodic to the member with the lower anodic index and will be susceptible to corrosion in the presence of an electrolytic medium. If the surface area of the cathodic part is significantly greater than that of the anodic part, the corrosive attack on the contact area of the anodic part may be greatly intensified. Material selection for intermetallic contact parts, therefore, should establish the smaller part as the cathodic member of the couple, whenever practicable.

6.9.4 Plating. When base metals intended for intermetallic contact form couples not allowed by table V, they are to be plated with those metals which will reduce the potential difference to that allowed by table V.

6.10 International standardization agreement. Certain provisions (3.1, 3.5.6) of this specification are the subject of international standardization agreement ASCCAS 12/16A. When amendment, revision, or cancellation of this specification is proposed which will affect or violate the international agreement concerned, the preparing activity will take appropriate reconciliation action through international standardization offices, if required.

6.11 Changes from previous issue. Asterisks are not used in this revision to identify changes with respect to the previous issue, due to the extensiveness of the changes.

APPENDIX

Procedure for Qualification Inspection, and Mounting and Terminal Hardware.

10. Scope.

10.1 This appendix details the procedure for submission of samples for qualification and group B inspection of toggle switches covered by this specification. This appendix also lists mounting and terminal hardware used with toggle switches covered by this specification. Mounting and terminal hardware should be of the following design and construction as specified (see 3.1).

20. Samples.

20.1 Qualification. For qualification inspection, the sample size shall be as specified in table II and the tests shall be performed in the sequence shown.

20.1.2 Single submission. A sample consisting of the required number of specimens of each switch shall be submitted. Qualification shall be restricted to the type submitted.

20.1.3 Group submission. A sample consisting of the required number of specimens of each basic switch listed in table VI shall be submitted and shall be subjected to the qualification test sequence of table II in the order shown. In addition, two specimens of each of the other switches listed in table VI shall be submitted and shall be subjected to the examination of product and switching characteristics test of table II.

20.2 Group B inspection Sample units shall be selected at random from lots that have passed group A inspection.

20.2.1 Single submission. The sample size shall be as specified in table II and the tests shall be performed in the order shown.

20.2.2 Group submission. A sample consisting of the required number of specimens of each basic switch listed in table VI shall be subjected to the test sequence of table II in the order shown. In addition, two specimens of each of the other switches listed in table VI shall be submitted and shall be subjected to the examination of product and switching characteristic test of table II. If the basic switches of a group are not in production at the time of selection of samples, other switches of the same group may be submitted, but maintained action switches shall not be substituted for momentary action switches.

INSTRUCTIONS: In a continuing effort to make our standardization documents better, the DoD provides this form for use in submitting comments and suggestions for improvements. All users of military standardization documents are invited to provide suggestions. This form may be detached, folded along the lines indicated, taped along the loose edge *(DO NOT STAPLE)*, and mailed. In block 5, be as specific as possible about particular problem areas such as wording which required interpretation, was too rigid, restrictive, loose, ambiguous, or was incompatible, and give proposed wording changes which would alleviate the problems. Enter in block 6 any remarks not related to a specific paragraph of the document. If block 7 is filled out, an acknowledgement will be mailed to you within 30 days to let you know that your comments were received and are being considered.

NOTE: This form may not be used to request copies of documents, nor to request waivers, deviations, or clarification of specification requirements on current contracts. Comments submitted on this form do not constitute or imply authorization to waive any portion of the referenced document(s) or to amend contractual requirements.
