FOREWORD

MIL-STD-1235A-1 contains functional curves for the CSP-1, 2, V, and T procedures contained in MIL-STD-1235, as well as a description of their use.

Curves for the CSP-F procedures are not provided, since exact methods for their determination have not been developed.

SECTION 1

GENERAL DESCRIPTION OF THE FUNCTIONAL CURVES

1.1 SCOPE

1.1.1 Purpose MIL-STD-1235A-1 provides functional curves of the continuous sampling plans contained in MIL-STD-1235A (with the exception of the CSP-F plans). It provides a description of the functional curves and includes guidelines for interpretation of the curves.

1.1.2 Applicability The functional curves described herein are provided for information to the user of MIL-STD-1235A. Use of the curves in accordance with the guidelines presented herein may assist the user in determining the procedure most suitable for his application. Approval of the use of any procedure is reserved to the consumer.

1.2 DEFINITIONS

1.2.1 AFI The Average Fraction Inspected (AFI) is the fraction of product that will be inspected over the long run if the process average is a particular value.

1.2.2 AOQ The Average Outgoing Quality (AOQ) for a particular process average is the long run expected percentage of defective material in the accepted material, if the associated sampling plan is followed faithfully.

1.2.3 AOQL The Average Outgoing Quality Limit (AOQL) is the maximum of all of the possible values of AOQ if the associated sampling plan is followed faithfully.

1.2.4 Code Letter The index of the sampling plan obtained from Table 1-A of MIL-STD-1235A.

1.2.5 Functional Curve A functional curve describes the relationship between some property of a sampling plan and the percent defective of submitted product. The types of functional curves presented herein are the AFI curves, the AOQ curves, and the O.C. curves.

Source: https://assist.dla.mil -- Downloaded: 2026-10-26T07:42Z
Check the source to verify that this is the current version before use.

1.2.6 O.C. The operating characteristics (O.C.) of a continuous sampling plan describe the percent of product accepted during the sampling phases of the plan over the long run if the process average is a particular value.

1.2.7 Target AOQL The target AOQL is the value of AOQL which was used to determine plan parameters. The actual AOQL may differ slightly from the target AOQL in some cases since an appropriate set of plan parameters to yield the target AOQL exactly does not exist in all cases.

1.3 PROCESS AVERAGE

The process average (PA) is defined as the percent defective of product submitted by the supplier for original inspection. Original inspection is the first inspection of a particular quantity of product as distinguished from the inspection of product which has been resubmitted. The phrases "Process Average" and "Percent Defective of Submitted Product" are used interchangeably.

A reasonably good estimate of the process average can be made from the inspection results. If the inspection results used are for a set period of time or a preset number of items within a production interval, the process average can be estimated as follows:

$$P.A._{est} = \frac{100(\text{number of defectives observed})}{\text{number of units inspected}}$$

The estimate of the process average, besides giving an indication of what percentage of manufactured product is defective, can also be used to consult the curves provided herein.

1.4 ARRANGEMENT OF CURVES

The curves are arranged in such fashion that when opened to a page of curves, the AOQ curves for a set of plans would appear on the left page, along with the legend. The AFI curves for the same set of plans would appear at the top of the right page, and the O.C. curves at the bottom of the right page.

Source: https://assist.dla.mil -- Downloaded: 2026-10-26T07:42Z
Check the source to verify that this is the current version before use.

The curves are ordered by AQL and Target AOQL. In this case, AQL is provided only as an index for simplicity when it is listed in the specification, and has no meaning with relation to continuous sampling plans.

1.5 AOQ CURVES

AOQ curves are provided for each of the CSP-1, CSP-2, CSP-T and CSP-V plans contained in MIL-STD-1235A. The curves indicate what percent of material accepted over the long run is defective for a particular value of process average. It should be noted that for values of the process average indicating poor quality, the corresponding values of AOQ are not of great interest, since corrective action should be taken to improve the process under such circumstances. The vertical axis on each of these curves is labelled "Average Outgoing Quality". The horizontal axis is labelled "Percent Defective of Submitted Product". These curves can be used to obtain an idea of the outgoing quality properties of the plan in use and may be of special interest when the process average is computed as described in 1.3. Each of the curves is indexed by AQL, Target AOQL and sampling frequency code letter. AOQ curves for CSP-1, CSP-2, CSP-T and CSP-V are contained in Sections 2, 3, 4 and 5 respectively.

1.6 AFI CURVES

AFI curves are provided for each of the CSP-1, CSP-2, CSP-T and CSP-V plans contained in MIL-STD-1235A The curves indicate what fraction of submitted material will be inspected over the long run for a particular value of process average. It should be noted that the corresponding values of AFI are not of interest since corrective action should be taken to improve the process under such circumstances. The vertical axis is labelled "Average Fraction Inspected". The horizontal axis is labelled "Percent Defective of Submitted Product". These curves can be used to obtain an idea of the amount of inspection required over the long run for the plan in use and may be of special interest when the process average is computed as described in 1.3. Each of the curves is indexed by AQL, Target AOQL and sampling frequency code letter. AFI curves for CSP-1, CSP-2, CSP-T and CSP-V are contained in Sections 2, 3, 4 and 5 respectively.

1.7 O.C. CURVES

Operating Characteristic (O.C.) curves are provided for each of the CSP-1, CSP-2, CSP-T and CSP-V plans contained in MIL-STD-1235A. The curves indicate what percent of material over the long run will be accepted during the sampling phases of the plans for a particular value of process average. It should be noted that for values of the process average indicating poor qia;otu. the corresponding percent of material accepted during the sampling phases is not of great interest, since corrective action should be taken to improve the process under such circumstances. The vertical axis on each of these curves is labelled "Percent of Product Accepted Under Sampling", and the horizontal axis is labelled "Percent Defective of Submitted Product". These curves can be used to obtain an idea of the operating characteristics of the plan in use, and may be of special interest when the process average is computed as in 1.3. Each of the curves is indexed by AQL, Target AOQL and sampling frequency code letter. O.C. curves for CSP-1, CSP-2, CSP-T and CSP-V are contained in Sections 2, 3, 4 and 5 respectively.
