DATA ITEM DESCRIPTION
Title: AIRFRAME FASTENER USAGE GUIDELINES

Number: DI-SESS-82231
AMSC Number: N9960
DTIC Applicable: N/A
Preparing Activity: AS
Applicable Forms: N/A

Approval Date: 20180710
Limitation: N/A
GIDEP Applicable: No
Project Number: SESS-2018-037

Use/relationship: This document establishes the engineering criterion for the selection and application of mechanical fasteners for both air vehicles and aircraft stores. The overall objective of this document is to provide design activities or integrated product teams (IPTs) with fastener subsystem standard policies and design information; it documents selection and application information for fastening systems and procedures so the designers or IPTs can achieve an optimum balance of performance, reliability, and standardization with minimum cost, logistic inventory and maintenance.

This Data Item Description (DID) contains the format, content, and intended use information for the data product resulting from the work task described by the contract SOW.

Requirements:

1. Reference documents. The applicable issue of the documents cited herein, including their approval dates and dates of any applicable amendments, notices, and revisions, shall be as specified in the contract.

2. Format. Contractor format acceptable.

3. Content. The Airframe Fastener Usage Guidelines shall contain the following:

3.1 Fastener Usage Approach: Describe the approach for developing and implementing uniform requirements applicable to aerospace fasteners that are capable of preserving the structural integrity and material compatibility of the system's elements being joined. The approach shall address fastener attributes such as: the process for development of fastened joint allowables; designation of external and internal thread form; definition of minimum dimeter of structural fasteners; definition of drive and wrenching element configurations; identification of usage limitations specific to external and internal threaded fasteners, washers, inserts, studs and pins, rivets and blind fasteners, door and access panels, single point linkages, potential for galvanic corrosion).

3.2 Describe controls to optimize performance, reliability and quality of fasteners while minimizing cost, fastener variety, logistic inventory and maintenance tasking.

3.3 Describe the contractor's engineering knowledge base of fasteners and their appropriate application (i.e., a compilation of contractor best practices and lessons learned for designers/design teams who must select and apply various fasteners to system components).

3.4 Describe exceptions and/or deviations from the JSSG-2009 Fastener subsystem guidelines as applicable to the system with justification for the exception and/or deviation.

Check the source to verify that this is the current version before use.

3.5 Joining Methods: Describe processes for joining and securing airframe/store structural members, air vehicle/store components, access panels, and doors while preserving the structural integrity of the elements being joined.

3.6 Common Fasteners: Describe the plan for use of common fasteners without compromising performance.

End of DI-SESS-82231
