DATA ITEM DESCRIPTION

Title: Security Verification Plan and Procedures

Number: DI-QCIC-81689 **Approval Date:** 14 AUG 2006
AMSC Number: 7604 **Limitation:** N/A
DTIC Applicable: N/A **GIDEP Applicable:** No
Office of Primary Responsibility: NS/I312
Applicable Forms: N/A

Use/Relationship: The plan describes a series of tests to verify that cryptographic principles and protective alarms embodied in equipment agree with those stipulated in the contract. It describes the Information Assurance (IA) circuitry and functions incorporated, outlines the proposed verification techniques and procedures to be employed, and identifies the test data parameters to be measured.

This Data Item Description (DID) contains the format and content preparation instructions for the data product generated by the specific and discrete task requirement as delineated in the contract.

This DID is applicable to systems and equipment acquisitions involving cryptographic capabilities.

This DID is related to: DI-QCIC-81690, Security Verification Report; and the Tailored Security Design and Analysis Requirements Specification supplied with the contract.

Requirements:

1. Reference Documents. None.

2. Format. The plan shall be in contractor's format with the following exceptions:

2.1. Page size. The size of each finished page shall be on 8 1/2" x 11" paper (metric size A4). Drawing and illustration fold-outs may be used, but must not exceed the 8 1/2" x 11" limits when folded. Photo-reduction of oversized pages is preferred, provided such reductions are easily readable and reproducible.

2.2. Binding. The plan shall be bound in such a manner that pages can be removed without damage or mutilation.

2.2.1. Change/revision identification. Changes shall be by replacement change pages with revision changes and additions from earlier versions being identified by a solid vertical bar and applicable revision number/letter on the outside page margin. Revision deletions shall be identified by an asterisk and revision code in the outside margin.

3. Content: The plan shall contain front matter and four sections as follows:

Source: https://assist.dla.mil -- Downloaded: 2026-10-26T10:52Z
Check the source to verify that this is the current version before use.

Front matter:

Cover and Title Page. The following information shall be included on the cover and Title page:

a. Plan and Procedures date of issue.
b. Plan and Procedures document number/revision number or letter.
c. Contract number.
d. Contractor name and address.
e. Title of plan.
f. Program title, including program name and Telecommunications Security (TSEC) Joint Electronic Type Designation (JETDS) number as applicable.
g. Security classification, if classified.
h. Distribution statement.

Revision Control Page. The revision control page shall list the following information:

a. Each revision number or letter.
b. Date of each revision.
c. Pages affected by each revision.

Table of Contents. The table of contents shall identify the following:

a. The title and starting page of each major section and paragraph of the plan.
b. The page, identifying number, and title of each drawing, illustration, figure, and table.

Section I, Functional description. The functional description includes a detailed description of critical Information Assurance (IA) circuitry using flow charts, networks, and narrative as appropriate to depict time-referenced signals. The descriptions shall address, as a minimum, the following listed functions, and any others specified in the Functional Security Requirements Specification supplied with the contract. Each description shall be in a context suitable to allow a functional computer simulation specifying as necessary, time-referenced functional signals.

a. Alarm.
b. Alarm check.
c. Safety device.
d. Key generate.
e. Variable load/change/generate.
f. Parity check/generate.
g. Remote keying.
h. Randomization.
i. Synchronization.
j. Zeroization.

Check the source to verify that this is the current version before use.

k. Access Control Mechanisms.
l. Digital Signature Verification.
m. Integrity Mechanisms.
n. Cryptographic Algorithms.

Section II, Verification technique description. This section shall describe precisely each proposed test, operation, or technique, which is intended to verify the embodiment, as described, for each specified function contained in Section I. The description shall include, if appropriate:

a. The level of verification (chip, board, box, etc.).
b. Time-referenced functional signals.
c. Signal format.
d. Expected signal response.
e. Number of tests.
f. Test equipment.

Section III, Data Description. This section shall include a description of the data, type, format, and signal names to be provided as a result of the verification tests.

Section IV, Procedures. This section shall include the detailed steps of how each test will be conducted. Each step shall be limited to one simple operation. The procedures should be detailed enough so that a person who is familiar with the test equipment could easily perform the test with these procedures.

4. END OF DI-QCIC-81689.
